More In this in-depth review of the team™ Image Hanging Strips, you'll learn exactly how to use them (step-by-step with pictures), common errors when using them, what surfaces they work, different sizes available, the most significant flaws, and general consumer complaints. Let's dive right in! Picture Team Hanging Stripes: A Quick Review of the Brand Team, creator of The Picture Hanging Stripes team (see Amazon), is the market leader without adhesive damage. In addition to picture hanging stripes, they produce clips for outdoor lighting, hooks for hanging things on glass windows and doors, caddies for storing walls, and more. The Picture Hanging Stripes team have a specially designed glue and patented design that allows you to hang photos securely to the walls without leaving behind a sticky residue or pulling the paint off the wall. If you're a fickle decorator, this is the perfect product. Change your mind about a painting or a photo? No problem. You can easily hang, remove and customize. Never put another hole in the wall when you use Command Picture hanging stripes. Team lanes have two drawbacks. First, if you don't follow the instructions, you run the risk of the image falling off the wall. This will only happen if you exceed the weight limits and don't use enough bands, or you don't allow enough time for them to stick to the wall before adding weight to the image. The second drawback is that they are expensive compared to a hammer and a nail. Depending on the size and weight of your picture, it can cost you a few dollars to hang out with the band team (check prices on Amazon) compared to a few cents with a nail. On the other hand, if you use command strips, you don't have to pay for putty walls and paint when you end up having to patch holes. How to use command picture hanging stripes the most common use for these paintings hanging strips, you guessed, hang heavy (or light) framed photos on walls and other surfaces without damaging them with nails and anchors. Here's how it works: Step 1: Wipe the wall with alcohol to remove dust and debris. Do not use other household cleaners as they may leave behind a film or residue that can make stick strips ineffective. Step 2: Separate the two strips and press the Velcro pieces together. They come in 3 different sizes (small, medium and large) and each size has its own weight limits. A small picture of hanging stripes can be for 1 pound per pair. Mediums hold 3 pounds per pair, and large hold 4 pounds per pair. If you're not sure how much the frame weighs, stand on the scale, The current weight, then pick up the frame and step back on the scale to see the difference. Step 3: Remove the protective liner from the side stripes and place a sticky surface on the frame with pull the tab face down. Pull tab is a rounded part that says 3M with an arrow pointing down. If you use one pair of strips, insert it horizontally in the center of the top of the frame. If you use two pairs, place them on the top corners of each side of the frame. If you use three pairs, place one horizontally in the center of the top frame and two on the top side. If you use four pairs, place two at the top of the side frames and two at the bottom of the side frames about 2/3rds way down. Don't let the lower bands down to the lower corners because it will make it very difficult to safely remove the painting from the wall when the time comes. Step 4: Remove the protective earbuds that are now facing off the frame and place the frame where you want it to be on the wall. If you don't get the level of the frame on the first try, you can customize where each side of Velcro is to get it perfectly level later. Press the frame firmly against the wall for at least 30 seconds. On the pressure on the areas where the strips are, they stick to the wall. At this point, the manufacturer's website advises you to clean the frame from the wall and let the stripes on the wall side sit for an hour before re-hanging the frame. This period allows the glue to stick completely to the wall before adding weight and frame resistance. To be honest, I have never followed this step and never had a problem. In my experience, as long as your wall is clean and you press the frame against the wall and hold tight for 30 seconds, you should be all set. A couple of times, I used two pairs of bands when I really had to use three, and the frame detached and dropped (whoops!). Adding an extra pair may be redundant, but never hurt. How to remove a command image of hanging strips of Team bands make removing photos from the wall very easily. To remove the frame, all you do is take the lower corners of the frame and slowly remove it from the wall. A pair of bands attached to Velcro will easily fall apart. Don't pull the frame directly from the wall. To remove the strips from the wall, slowly stretch the tab straight down about 12 inches. He'll let it out of the wall. Don't pull the tab directly to you; it can damage the wall. This video does a great job of summing up the process of hanging photos that I just described: Common errors when using command lanes If you follow the instructions carefully, the team bands are very effective. If you cut corners and don't follow the instructions, you'll have problems. Here are the most common mistakes that people make when using command lanes: Not using enough bands. If you use one pair of stripes to hang a 20-pound frame, Fail. Don't push hard for at least 30 seconds when hanging. The pressure on the strips helps them to stick to completely. Don't miss this step. Pulling the frame off the wall the wrong way. If you pull the frame directly from the wall, you run the risk of damaging it. Pulling the stripes off the wall the wrong way. Pull the tab straight down until the band releases away from the wall. If you try to rip it off right away, the paint will come with it. Do team lanes work on all surfaces? Command lanes work on most surfaces, but not at all. The surfaces on which they can be used are painted, painted or lacquered with wood, glass, tiles, painted cinder block, plaster, drywall, metal and painted wall board. They will also stick to a smooth cinder block like what you see inside school buildings. They do not stick to bricks, wallpaper or glass directly exposed to sunlight. Wait a week after painting to make sure the paint is completely cured before using these strips. The command has an open line of products (link to Amazon) that stick to some of these other surfaces and work well in the heat or cold. Options and Sizes Team has many different picture products hanging, here's a breakdown: Small Picture Hanging Stripes (view on Amazon) - Weight capacity: 1 pound for a couple of stripes - best for 8 x 10 frames. Command stripes (small) Medium hanging stripes image (view on Amazon) - Weight capacity: 3 pounds per pair of stripes - best suited for 18 x 24 frames. Command stripes (medium) Large hanging stripes of image (view on Amazon) - Weight capacity: 4 pounds per pair of stripes - best suited for 24 x 36 frames. Team strips (large) If you use small stripes and your frame weighs 6 pounds, you need six pairs of bands. If you use large and the frame weighs 8 pounds, you need two pairs. You'll understand the idea. The product mentioned above is the basis; However, the command also makes hanging strips for large canvases, easel rear frames, narrow, wire back, and more. You can find all these products in your local store of large boxes or online on Amazon. The team at big 3M store, the parent company of Command Brand, invests about 6% of its revenue back into research and development (more than \$1 billion per year) to improve its current products and invent new ones continuously. This dedication to innovation is why their products, including the image of hanging stripes, are so useful. Team Band Weight Restriction (Graph) One of the most frequently asked questions about team bands: How much weight can they hold? In the previous section I highlighted the three most popular product teams (Small, Medium and Big Stripes), but they sell many other pictures of hanging stripes and hooks with different weight restrictions. Here's a quick chart, breaks the weight limits of each type of command lane. Two Fast Notes: 1) Weight Weight on this graph are based on only one pair of bands. 2) Product names are linked to Amazon, where you can check out more information. (Source of weight limits: Command.com) What are the biggest drawbacks of team bands? Team lanes are efficient, easy to use and convenient, but they have drawbacks. The biggest knock on the team lanes, compared to nails, they are expensive. You could probably buy a hundred nails for the price of one pack of team bands. However, when this moment finally comes when you have to take down a picture by buying wall putts, grinding, painting, and stays with a less perfect wall a much higher price than the cost of these bands. Second, hanging photos with team bands takes more steps than it does with a hammer and a nail. Although these steps are quick and easy, you should have the right number of strips, make sure you place them on the frame correctly, remove the lid, press hard, etc. I don't see this as a significant drawback, but it's worth mentioning. In addition, as you'll see in the next section, the command lanes can detach from the wall and destroy the frame, art, or photo. If you follow the instructions, the chances of this happening are slim, but it will certainly happen. The last drawback is that you can only use the command lanes once. The command designs its pull-tab release mechanism to make sure there is zero damage to the wall. When you pull the strip to remove it from the wall, it stretches and becomes unusable. Unfortunately, you can't use them more than once, but pay a little more for strip beats the time it takes to fix the holes. What are the most common complaints? If you scroll down and check out the comments on this review, you will find that most of the complaints about this product are related to the lack of stickiness causing expensive footage and photos to fall off the wall. I totally understand how frustrating and upsetting it can be to have an expensive work of art or a sentimental photo crashing to the floor. However, if you follow the instructions-clean the wall first, use the appropriate number of strips, apply pressure before hanging- you significantly reduce the risk of photos detaching from the wall. With products like this, there is a tendency to rip off the package and start using it without reading the label. This is not a complex product or process, but you have to follow several instructions. Even if you follow the instructions with this type of product, there is still a small chance the bands will lose their stickiness. The most likely culprits are sudden changes in room temperature or humidity in the air. My advice, if you're hanging something really expensive or priceless, use a nail or double up on the band command. Alternatives strips besides hammer and nail, there are not many viable alternatives Strip. Two-way tape/glue strips, like Scottish Indoor Mounting Tape and Gorilla Mounting Tape, are a normal alternative. However, based on my personal experience and extensive research, I would not be comfortable recommending any other brand other than Command. This is the best option for hang photos and will not leave behind a sticky residue like these alternatives. Bottom line: Are the team lanes worth it? The best way to hang heavy paintings, art, painting, or anything flat drywall, wood, glass, tiles, plaster, or most other surfaces in your home is to use the Picture Hanging Stripes team. The main focus of The Command Brand products is hanging things on the walls, and in my opinion they nailed it (pun intended). These sticky Velcro strips will cost a little more than nails, but they do their job and leave your walls completely smooth with no holes or leftovers left behind. The result is a beautiful, reliably hung painting and walls in pristine condition. So yes, the Picture Team Hanging Stripes are worth it. To see more information and prices, check them out on Amazon. Thank you for reading our review team Picture Hanging Stripes! We hope you enjoyed reading our review and that now you can confidently hang photos without using nails. Have you had a different experience with the Picture Hanging Stripes team? Do you agree or disagree with our review? Are you on the best options for hanging photos? Please let us know in the comments section or contact us directly. We would like to hear your feedback. Want to improve your home life? Check out these latest articles: articles:
