At Clarivate, we pride ourselves on the history that underpins our work to accelerate innovation. This year marks 60 years since Dr. Eugene Garfield founded the Institute of Scientific Information (ISI)™. Today is the basis of experience, experience and deep thinking that drives our editorial rigor, our policies and partnerships, ratings and analytics to help solve the problems of our community. In 1975, the research community first used the Web of Science Journal Citation Reports™ (JCR) to help them make better decisions with confidence by identifying and evaluating the world's leading journals of science and social sciences. JCR includes a wealth of information, including general documents, general citations, citing and quoted data from the journal, quoted and citing data on semi-diversity, the spontaneity index and, of course, the impact factor of the Web of Science Journal™ (JIF). While much has changed over the years, as magazines have moved from print to digital, and the number of magazines around the world has exploded, JCR's mission remains the same: to provide a thorough, neutral for publishers, a multifaceted look at the work of magazines, reflecting the best scientific and scientific literature in the world. Today we are launching JCR 2020, which marks the latest evolution in our rich array of journal citations, descriptive data and visualizations taken from 2019 data from the Web of Science Core Collection™. There is no doubt that Impact Factor magazine has become one of the most popular but controversial data; it was designed to assist ISI in selecting journals, librarians in the development of the collection and information of scientists and other researchers in understanding patterns of communication between journals. Dr Garfield himself pointed to the misuse of Impact Factor magazine public places and in print. We continue to emphasize that JCR provides journal profiles with a rich data context and should not irresponsibly applied to broader research management. New by 2020, we are pleased to present: New descriptive data on open access models: New data shows articles of each magazine by access model. This provides the research community with transparent, neutral information for publishers about the relative contribution of articles published free of charge for reading and reuse under Creative Commons licenses (golden open access) to the total content and citations of the journal. For hybrid magazines, readers can now quickly and easily determine the number of articles published under the traditional subscription model and documents published through Creative Commons licenses. Updated Journal of Self-Citation Options: To maintain integrity reports, Clarivate suppressed 33 magazines from JCR this year, which is 0.27% Listed. JCR monitors and excludes magazines, magazines, abnormal citation behavior, including where there is evidence of excessive self-citation of the journal and the stacking of citations. By 2020, the methodology and parameters of the impact of citing journals on JCR indicators have been updated to better take into account discipline standards. In addition, 15 journals published an editorial expression of concern, during which one or more published articles with uncharacteristically high contribution to the JIF numerator and the model of citations of journals are disproportionately concentrated in JIF numerals. We will continue to review the content of this type in order to develop additional screening for the distortion of the journal's impact factor. Explore the highlights from the 2020 Journal Citing Reports here. For more information, visit the Journal Citation Reports page to explore all available data, metrics and analysis, and follow the #JCR2020 on social media. The 2020 edition of Citation Reports® (JCR), published by Clarivate Analytics, contains a combination of exposure and impact indicators of Web of Science's raw data for 2019. This measure ensures the ratio of citations to the magazine in this year to citable items in the previous two years. Download the Annual Reviews 2020 Edition JCR Ratings in Excel format. See our full list of published journals. The updated citation figures were published in the journal Citation Reports (JCR) published by Clarivate. The recent release of JCR includes seventy-one MDPI titles. Of these, 18 titles are newcomers, receiving the first Impact Factor magazine, which is based on citation activities in 2019: Actuators, Agriculture, Biology, Biomedicine, Biosensors, Chemosensor, Children, Healthcare, Mushroom Journal, Journal of Personalized Medicine (JPM), Earth, Life, Magnetochemistry, Membranes, Pharmaceuticals, Photonics, Separation and Toxic Substances. Of the previously listed journals, a total of 72 percent boast an elevated exposure factor. 28 journals are among the top 25% of magazines in at least one of the categories by which they are ranked. Articles published in 2019 in the journal MDPI account for about 17 percent of articles published in the journals Golden Open Access, published in the journal Science Citation Index Expanded (SCIE) and Social Sciences Citation Index (SSCI).
