Get a \$1 credit for every \$25 spent! What Included Terms Instant Digital Redemption Get \$1 loan for every \$25 spent! With The Terms of All Sales Terms included the final due to the nature of the range design, you can get multiples of the same design rumors abound that Apple and Samsung are preparing to sell their next generation of premium smartphones without a charger in a box. At first glance, the \$1,000 flagship sold without a charger is pretty unthinkable. Just another example on the industry charging more for less money (RIP, headphone jack) and copying us consumers. However, I have come to a different way of thinking. At the very least, allowing manufacturers to meet multiple conditions first. No in the box Chargers can actually be good. Just listen to me before the blazing comments. We asked you to tell us: You hate the idea of Apple dropping into a charger box We've been here before, back when the plug-in was plugBefore dipping in the case against the phone's kit chargers, it's worth remembering that selling phones without a charger is not a whole new concept. A few years ago, it wasn't uncommon for medium-range phones to send without a USB connector. In fact, the British network O2 and HTC merged back in 2013 to sell the flagship HTC One without a charger. At the time, O2 claimed that 70% of customers buying a new phone already have a proper charger. 82% of customers bought a phone without a charger during the six-month trial, so this was not an unpopular initiative. Today, even some Amazon Kindle tablets only ship with USB cables and not chargers, because basically any standard 2.5W USB plug-in is enough to power them. This idea was perfect back in the days when the charger had a charger and everything was cross-compatible. It's much more complicated in today's market filled with a variety of fast charging and proprietary standards. Fortunately, there is a road leading back to the ubiquitous charging superhighway. Forget about your own charging, let's all use USB Power DeliveryIf you have something like me, you'll probably have a box full of old USB chargers from a bygone generation of mobile devices. The main reason we have to switch chargers with a new phone is because the new fork is the fastest way to charge. The own charging standards, used by a wide range of manufacturers, just don't play nicely with other phones, and sometimes aren't fully back-compatible either. This is one of the main reasons why USB-C is just a confusing mess. Fortunately, almost all of the latest smartphones play beautifully with USB Power (USB PD), even if it's not the fastest way to charge every phone. USB PD is a great backup option at worst, but it's a quick charging method of choice for Google, Nokia, Samsung, and some others too. As long as Samsung, and anyone else who ditches the box charger, supports USB-C and USB Power Delivery correctly, we will quickly enter the blissful world with the ubiquitous charging standard. This includes mid-level and affordable devices too. As long as Samsung et al support USB Power Delivery is correct, we don't need box chargers anymore. This is very good for us consumers too, as it means we can buy one charging brick that serves multiple devices, often at once. This includes many of the latest laptops and other gadgets that increasingly support USB Power Delivery. I actually have such a brick as my salon charger and I rarely reach for my own cork anymore. This requires a change from Apple too, of course. The company stubbornly attached to the Lightning connector for iPhones, despite ditching the port in favor of USB-C for iPads. However, the latest iPhones already support USB Power Delivery, just over the Lightning connector, rather than USB-C. Thus, they are already compatible with a wide range of products on the market, through an adapter. It's actually a company with own charging technologies like Oppo, OnePlus, and Huawei that will holdouts to this unified way of thinking. They have invested heavily in technologies that are faster than USB Power Delivery, making them market-based different products. Huawei and Oppo in particular ship phones in large quantities, so it's unlikely we'll see a wider industry stop providing box chargers anytime soon. However, many phones from these brands support USB PD too, so you're not trapped with their own technology. This should mean companies can't ditch box chargers just to increase profits, at least without throwing USB PD too. If the wires aren't your thing, wireless charging is also aimed at solving a similar problem too, don't forget. Everyone on board eco-train! tends to view green fads with a healthy dose of skepticism, but it's a well-documented fact that a hefty portion of e-waste takes the form of old chargers. Outdated forks produce an estimated 51,000 metric tons of waste each year in the European Union alone. This is partly why EU lawmakers voted to pass legislation on a single charging standard in early 2020. You may not be surprised to learn that Apple initially lobbied against the idea. Going back, waste was also the driving force behind the O2 initiative in 2013. A study by the carrier found that there were up to 100 million unused chargers in the UK. Weighing a total of 18,700 tons, spend 124,274 miles of copper wire and plastic covers, and the equivalent volume of four Olympic pools is worth the debris. Remember, it was in one country, seven years ago! You don't have to be an eco-warrior to be sick to own 101 different chargers Cutting down these wastes, most of which contains precious metals and other limited resources, is an easy victory, given that the industry already has the perfect solution. With this in legislation should not be necessary if only manufacturers could get on the same consumer page this time. Going green is pretty low-hanging fruit for their marketing departments too, so what's the hold-up? They certainly can't let Samsung hog into the spotlight with its marketing for eco-friendly chargers. The long-term benefits outweigh any teething problems There's only one flaw in the industry to move away from in-box chargers to leaving customers to pick up their own USB Power Delivery products. Some consumers may no longer have a USB PD charger in hand, especially if they haven't bought a flagship in the last few years. But even that's not too big a problem. First, remember that USB is compatible on the back. The new phones will charge (albeit slowly) with any old USB adapter you have lying around. You can even get half a decent speed from an old fast charging plug, USB 3.0 port, or an adapter from another phone manufacturer. So this is not a hopeless situation, even in the worst case scenario. Second, USB Power Delivery plugs and other accessories are not expensive anymore. You don't need a 100W USB PD brick laptop for smartphones. You can pick up 18W fast charging corks from reputable manufacturers for less than \$20. 40W to 60W multifunctional chargers are available too, often costing less than \$40 for new fashion options such as GaN. It really isn't a steep price to pay for a charger that will power all your gadgets for years to come. Need some suggestions? The best multi-port USB wall chargers course, if phone manufacturers ditch in a box chargers brazen speculator out their own accessories and standards, ignore all of the above and let me know where I can take the bus outrage. Removing the box charger would, at best, shave a symbolic amount off the price of the flagship phones (think \$20, not \$100). So it is not the potential or lack of savings that should concern consumers. But what will certainly be outrageous is manufacturers removing universal charging support and then selling their own forks as accessories. However, this seems highly unlikely given the already widespread adoption and wider industry push for USB Power Delivery.Ok, have you heard of me, so are you ready to ditch the box-based chargers and adopt a universal standard? Linux is the most widely used open source operating system in the world, especially in the technology industry. If you want to become one of the gurus on this platform, today's deal is your launching pad. Popular Linux Power User Bundle Today for just \$19. If you have going to find out, this could be your next big project. Linux operating systems are becoming increasingly popular in commercial computing environments, which means that talented system administrators are always needed. The adopters of this OS include tech giants such as Google, Facebook, Twitter, Yahoo and Power User Bundle consists of more than 22 hours of expert-led training. Five specialized training kits are designed to teach even a full beginner, with step-by-step tutorials and practical examples. Linux Power User Bundle: The bundle is currently rocking a five-star rating, and only at \$19 instead of the cumulative \$600 value, you get every hour of training for less than \$1. You won't find many more budget training courses out there. The deal ends very soon, so don't miss out. Click the button below to find out more. Is this deal not quite right for you? To see all our hottest deals, head to AAPICKS HUB. So you want to be a master of digital marketing, but have no idea where to start? Maybe you are interested in starting your own business but don't have the budget to hire someone to help build your online presence? Then check out the comprehensive guide to digital marketing in 2019 - marketing, SEO and Super Bundle affiliate marketing. You'll get lifetime access to 57 hours worth of lectures, content and instructions for everything from MailChimp and Google AdWords to Amazon, all for just \$37.This training series will help demystify digital marketing. You will learn to get more profit from investing in your Facebook ads and drive more traffic to your site with SEO. It is full of comprehensive content and lessons that will make you feel like a professional at any time. You will get 24/7 lifetime access to nine training kits including: Digital marketing professionals can make a very comfortable wage so that you can increase your own professional value or save money while claiming someone for your personal business. Take this bundle for \$37 today. The AAPicks team writes about things we think you will find, and we can see a share of the revenue from any purchases made through affiliate links. To see all our hottest deals, head to AAPICKS HUB. Like this deal?
