The Facebook Android app lets you delete messages, chat conversations and comments you've written. Conversations in Facebook chat are included along with other messages, texts and emails. You can also use Facebook's mobile web browser to delete messages, with the added bonus of being able to delete selected messages rather than the entire conversation story. Keep in mind that any messages you delete will only affect your own account and will still be visible in your friends' inboxes. Start the Facebook Android app and enter your account. Open your messages and find a conversation history you'd like to delete. Tap and hold the conversation until the optional menu opens. Select delete the chat to delete the conversation history. Start Facebook's mobile web browser and enter your account. Open your messages and select the conversation history you'd like to delete. Open the Action menu and select the Delete option to erase the entire conversation story. Open the Action menu and select the Delete option to manually select which messages you would like to delete. Mark the checkbox next to the messages you'd like to delete and click on the Delete option to erase them forever. Good thoughts can come from anywhere, at any time. It's available almost everywhere, it's reduced to ultimate simplicity, and it constantly saves you work, so you don't have to. This is what Adam calls the Holy Grail of ubiquitous text capture. Two Android customers provide the best Simplenote experience. This author prefers the paid (\$2.37-ish) SolidNote, but only because of the slight polish on the controls and seemingly less lag during input. mNote, a free alternative, does just as well as work just by displaying and saving your Simplenote stuff, and maybe you won't experience the same lag. Despite all the cool performance modern technology was born, the holy grail for me... From Android to iOS, and from Twitter to Slack, almost every app now has a dark mode. The only app that hasn't joined the dark side is the main Facebook. However, according to reliable leaked app Jane Manchun Wong, the social networking giant is currently testing dark mode on its Android app Wong also took to Twitter to share some of the early screenshots of the under-work under-work Looking at these screengrabs, we can safely say that it may be some time before Facebook rolls out the dark mode officially. Yes, Facebook has launched a special app exclusively for its group feature, and, well, it's pretty much a different user interface for current groups that already exist in the primary Facebook app. Unlike Messenger, which has been forcibly removed from Facebook's main app, Facebook sees the groups as a compliment to Facebook's primary app. Follow your groups here or on Facebook, depending on what makes you feel better, they say. There's not much more to say about Facebook groups. It's a Facebook group feature in the app. If Facebook groups are important to you, you can download it now for free from the Play Store. Facebook (NASDAQ:FB) has redesigned its android app to optimize it for use in countries where data is expensive and phones have less memory. According to a post on Facebook's engineering blog, Alex Surov reports that the app has undergone significant changes over the past year. It is now starting 50 percent faster than it was six months ago, uses 50 percent less data that it did a year ago and comes in downloading that 65 percent less than it was earlier this year. These numbers show that an update to an app is not a normal update, with minor fixes or improvements. Instead, it signals a new focus and serious commitment for the social networking giant. Facebook is gradually turning its attention to the developing world, in large part because it is where it still has the potential for huge growth. According to TechCrunch, Facebook has 202 million monthly users in the U.S. and Canada, compared to a total population of about 353 million. The market is relatively saturated, and while Facebook will continue to grow, it has no room for any more huge growth in North America. But, on the contrary, there are many areas in Asia, Africa and South America where many people do not have Facebook accounts. But they also often don't have access to fast networks or high-end smartphones that many Facebook users in their native U.S. use to access the app. Instead, many people in developing countries use lower-end Android smartphones, and slower networks. Surov that the company wants Facebook to work for everyone - regardless of the region, the state of the network or mobile devices. He describes a trip that product managers and engineers took to a place in Africa to see how the Facebook app would work: We purchased several different Android phones to test the latest version of the Facebook app - and the testing process proved difficult. The combination of intermittent network connectivity with low bandwidth and lack of memory space on devices has led to slow loading times and constant failures. We even burned our monthly data plans in 40 minutes. Surov explains that the team then worked to fix the problems to make the application viable for the new market. The app is now faster, and news in News Feed is downloaded more efficiently. Facebook switched its image compression format to WebP from JPG or PNG, reducing the amount of data they used without any perceived quality difference. The team optimized the resolution of the images displayed by downloading the additional resolution needed to zoom in if the user decided to zoom in. The team also improved the caching and reuse of images, optimized the effectiveness of processes such as image downloads, and reduced the size of the application to address the small disk space problem that lower phones typically have. A blog post on Facebook says the changes are ongoing and will be expanded to other Facebook apps such as Facebook Messenger and Instagram. The overhaul is consistent with the company's growing focus on building its user base and market in developing countries, as evidenced by some of its recent acquisitions. Facebook recently bought Helsinki-based Pryte, a startup that provides app-specific mobile data packages to users in areas of the world that data is still expensive. Under this model, users can pay specifically to have access to one app, such as Facebook, instead of buying a shared data plan. According to Mashable, the startup has not yet launched its service publicly, and the company had thirty employees in staff when Facebook bought it. At the time, Pryte's team wrote that it would help Facebook with another ongoing project, the Internet.org project that Mark Zuckerberg launched last year to bring Internet access to five billion people. The plans for Internet.org year and his overall mission to connect the world are also likely to include the use of the mobile messaging market, especially in areas outside the U.S., where another of Facebook's recent acquisitions, the hugely popular Messaging app WhatsApp, is setting Facebook up on The company's move to optimize its Android app shows that Facebook is serious about preparing for a market outside the U.S. and Canada. Because smartphones are getting cheaper, while the cost of data remains high in the world, Facebook is wisely considering how it can make its service as universally accessible as it can. So like other companies optimizing and rethinking how to customize their apps for slower networks and less capable phones, Facebook will already have its improved Android app in place and be ready to start adding users to its social network.
