Source: Harish Jonnalagadda / Android Central WhatsApp Web is a great way to expand the capabilities of the messaging platform on the desktop. The web client is easy to set up and use, it has the same visual interface as the mobile version of the app, and messages are instantly synced between the phone and the Internet. Here's how you can set up and use WhatsApp Web. What is WhatsApp Web? WhatsApp Web is what it sounds like: a web portal that lets you reflect your phone's WhatsApp experience on a desktop browser like Chrome, Firefox, Safari, Opera or anything else you like. In order to keep WhatsApp safe and closed, WhatsApp Web is not a separate copy of WhatsApp that lives independently of your phone. Instead, it relies on connecting your phone to WhatsApp to create the original copy, and then, by using a photo of a unique code to authenticate, it brings that accurate experience to the web. Once you get out of WhatsApp on your phone, the internet connection is severed. How to activate and use WhatsApp Web To use WhatsApp on the Internet, you need to link a web client with your phone. To do this, go to web.whatsapp.com on your computer. You'll see the code on the page, and you'll have to scan it with your phone to link your account to the web version. Here's what you need to do on your phone: Open WhatsApp from the app drawer or home screen. Click on the overflow action menu (three vertical points) in the top right corner. Hit WhatsApp Web. Put the phone on the CD code on web.whatsapp.com. Source: Harish Jonnalagadda / Android Central Here's all you need to do. Your account is now connected to a web client and you will be able to use WhatsApp directly from your browser. WhatsApp Web allows you to share documents, photos and videos, contacts and even use your computer camera to photo-family and share them. You can also view friends' stories, initiate new chats, change your profile picture, and use the chat search feature. Most of the features that you use on a daily basis on WhatsApp on your phone are available here, and this makes the WhatsApp Web a particularly great utility. If you are not interested in launching WhatsApp in your browser, you can download a Windows client and have it running on your computer. The true flagship of the 2020 Galaxy S20 has all the features you care about. You shell out a lot of money, but you also get a phone that will last a few years without any problems. Source: Joe Marin / Android Central While I Love My Android Devices and Google, I also have my feet firmly planted in the Apple world as well. I spend about half my time working on iMac. I have an iPhone in addition to my Android phones, and many of my and friends are on Apple devices as well. I suspect many of you are in the same boat. If you have iCloud calendars that you want to access from your Google calendar, what do you do? It's actually quite easy to move this data over; I'll show you how to do it. Open calendar.google.com in your web browser. Source: Android Central In a separate tab, open the icloud.com. Sign up for each account and confirm your identity as needed. On icloud.com, click on the iCloud calendar. Source: Android Central Find the calendar you want to copy and click on the curved lines (which look like a Wi-Fi symbol) to the right of the calendar name. Click on the checkbox for the public calendar. Below, click on Copy Link. Source: Android Central Return to the Google Calendar tab. From the left, click on the q sign next to other calendars. When the dialogue window pops up, click on from the URL. Source: Android Central Paste in a calendar link you copied from iCloud. When the link is pasted, change the text in front of the link with webcal at http. Click Add Calendar and you should see your new calendar appear in the Other Calendars section of your Google calendar. Source: Android Central If, for some reason, 11-12 steps don't work, you can insert a copied URL into the new tab. Then click Add when the dialogue box pops up. Source: Android Central You should see how your new calendar appears in the Other Calendars section of your Google calendar. Source: Android Central Now your iCloud calendar and previously added events will appear in google calendar views. However, if any subsequent changes to the iCloud calendar are made, you will need to repeat this process because they are out of sync with each other. If you want to keep ecosystems connected, you need to download a third-party app from the Google Play store and keep an eye on customization tips. We can earn commissions for purchases using our links. Learn more. Ben Stockton If you switch from iPhone to Android, you don't have to ditch iCloud services like iCloud Mail. While Apple doesn't make it easy to set up, you can log in and use your iCloud email address on Android. While we recommend Gmail, you should be able to add your iCloud email address to most email apps. Before you start creating an App-Specific password for iCloud, you need to set up an iCloud account. Apple's two-factor authentication usually makes it difficult to register third-party apps, but Apple allows you to create a separate password for specific apps for use on Android. First, sign up to your Apple account and scroll to the Security section. Under the Password button Click the Create Password button. If you don't see this section, you should set up two-factor authentication in your Apple account. You need a recent Mac, iPhone or iPad to make ANSWER: How to set up two-factor authentication for your Apple ID Provide a short but memorable description of that password (like Android login in) and then click Create. Save the password that Apple generates for you. You'll need to use this instead of an Apple ID password to complete the login process. Set up iCloud Email Access for Gmail With a separate app password, you're ready to sync your iCloud email with Gmail, the default email app for most people who own Android devices. Remember that this process should also work for other email customers, however; we cover more about what's below. First, swipe down from the top of the device to access the notification shadow, and then tap the gear icon. You can also access Android settings from your app box. In the main settings menu, click Accounts. Depending on your device and the Android version it works for, it may have a slightly different name like Accounts and Backup. If you're using a Samsung device, click the Accounts again in the next menu. For other Android devices, you should be able to skip this step. You see a list of accounts synchronized with your device. Scroll down and click Add account. Choose Personal (iMAP) with the Gmail symbol next to it. The Gmail registration screen is displayed. Use your iCloud email address and then click next. Use the password you generate for you (not the Apple ID password) and then click next. If your email address and password are correct, Android (via Gmail) is in the head and starts syncing your iCloud email account with your device. You may need to confirm some additional settings, such as how often you want Gmail to sync your email. To see if the process is working, start the Gmail app and then click the menu button in the top left version. You should see your iCloud email account with others; click on it to switch to it in Gmail. You can now use your iCloud email address to send and receive emails. Use Microsoft Outlook or other email apps that you don't have to use the Gmail app to get iCloud email on Android. There are other alternatives, such as Microsoft Outlook. The customization process is similar, no matter which app you choose. In the Outlook app, for example, click on the burger menu and then tap the add account icon (an envelope with a plus sign in the corner). Here, click the iCloud email address and then click On. Outlook detects that you're signing up with an iCloud account, so you don't have to do anything else. Enter the password and then tap the check mark in the upper right-right right to enter it. You should now be able to view and send emails from your iCloud email address. If you want to use another email app, look for an IMAP registration option when you sign up for your account or iCloud option. Use a generated password for process, and you should be able to use your iCloud email as if you were on an iOS or Mac device. Khamosh Pathak WhatsApp groups are well lit up to stay in touch with friends and family, but they can also be a hindrance and a source of spam. You can now prevent people from adding you to WhatsApp groups without your consent to iPhone and Android. Managing WhatsApp Group invites to Android With a new privacy setting on Android, you can now stop everyone, or just people not in your contact book, from adding you to the WhatsApp group. In fact, a special option in Android allows you to add exceptions to this list of blocks. On your Android phone, make sure you've upgraded to the latest version of WhatsApp. ANSWER: How to silence WhatsApp Group Notice Sounds Next, click on the Menu button in the top toolbar. Click Settings. Now select the Account option. From the Account section, click on the Privacy button. You'll find a variety of privacy-related chat options. Here, click on the Groups. In Who Can Add Me to Groups, you'll see three options: Everything, My Contacts and My Contacts Except. If you want to avoid spam, switch to my contacts option so that only users in your contact book can add you to the group. If you want detailed control over the process, choose my contacts option other than. You can then select specific users from the contact list who can't directly add you to the group. This is a great option if you know people who often add you to WhatsApp groups you don't want to be a part of. Now that someone not in your contact book is trying to add you to the group, they will get a message that they can't directly add you to the group. Instead, they can send an invitation to the group as a personal message. The WhatsApp Management Group invites to the iPhone Process is a little different on the iPhone. Instead of the option My contacts, except you have the option Nobody. This is a complete ban that stops everyone from adding you to the group directly. Open the WhatsApp app on your iPhone and click on the Settings tab from the toolbar. Here, choose the Account option. Next, click on the Privacy button. Select the Group option. Now you can choose between everyone, my contacts and Nobody. Everyone is the default. To only add your contacts to the group, select My Contacts option. If you want a total ban for everyone, choose Nobody. Now that someone tries to add you to the group, they'll see the Invite a friend button. When they touch it, you will receive an invitation to join the group as a personal message. This is just one way to protect your privacy on WhatsApp. You can beef up your WhatsApp security by adding Face ID and Touch ID protection for the app on an iPhone. RELATED: How to beef up WhatsApp's security on iPhone with biometric options and encryption how to restore whatsapp backup from icloud on android
