Photo: Mr.Mikla (Shutterstock)Screen recording features are great for guiding technology challenged family members using their new smartphone, capturing in-game footage, gathering evidence while reporting errors and more. However, not all devices allow you to record the screen the same way or easily.iPhone and iPad owners were able to record their screens with iOS 11, but the screen recording capabilities of Android were incompatible at best. Some manufacturers allow users to record their screens, but many don't, and while there are third-party screen capture apps out there, some are super shady and can pose a security risk. That will change once Android 11 starts rolling out later this year, thankfully. The new version of Android will include the built-in screen recording capabilities for the first time, finally bringing the long-awaited device feature near you (as long as it supports Android 11, anyway). You can even try it early by installing the latest public beta version of Android 11. How to record the screen of your Android, iOS or iPadOS deviceThere that screen recording is finally the native feature of Android, we figured it's time we put together a guide showing you how to record your screen in both Android and iOS/iPadOS.G/O Media can get commissionBoth easy enough to use, but you need to poke around a little- the feature is wisely stored in less convenient places to prevent random recordings. Also note that some apps don't allow you to record audio at the same time, and some devices may prevent you from sharing a screen, mirroring or casting apps, and recording the screen. AndroidSince is an Android 11 feature, you will need to install the latest beta version of Android 11 or wait for the final version to drop later this year. Some phones (like Samsung Galaxy) can screen recording even without Android 11, so it's possible your device may already be able to do so, although we're only covering Android 11 features for this article. Screenshot: David MurphySwipe down on the screen of your android device to expand the notification menu and then swipe down again to access the quick Settings. Swipe straight through quick customization shortcuts to find the Screen Record button and then click on it. On the next screen, you can choose whether to record audio and/or record screen taps. If you want to turn on the audio, click The Audio Recording button and then choose whether to record only your device's audio, audio microphone or audio from both sources. Click Start when you're ready to record. A small red recording icon will appear at the top right of the screen to indicate that the screen recording continues. To Record, swipe down to view the notification bar and then tap the red banner notification click to stop. Screen records are stored in the device's existing media folder and can be found with file file or in the Google Photos app under the library's Movies.iOS and iPadOS, instructions must work on any iPhone, iPad or iPod touch running iOS 11 or later. Open the Settings app and go to the Control Center to set up the Controls.Tap icon I'm next to the Screen Recording option. This next step will vary depending on the device/OS you use. For iPhone X or new and iPad with iOS 12/iPadOS 13 or later: swipe down from the top right corner of the screen. For iOS 11 and older devices: Swipe up from the bottom edge of any screen. Press the grey record icon (it looks like a big dot in a circle) to prepare the screen recording function. Tap the microphone icon on the On button if you want to turn on the audio microphone in your recording. Click start the recording and then wait for three seconds of countdown to the end. After that, the recording will begin. To stop recording, press the red bar at the top of the screen and then click the Stop button. You can also use the same gesture control you used in step 3 to open the Control Center and tap the Recording icon again to finish the video this way. Saved screen recordings can be found in the iOS Photos app. Android is the obvious choice for people who don't want the kind of top-down control you get from companies like Apple where everyone prefabricated to fit into a particular brand rather than catering to specific user needs and preferences. Google's open source software fortunately provides enough space for developers to customize your OS experience. But this freedom also seeps to you, which means that you can additionally personalize your home screen as you like it. But that doesn't mean you can just flick the switch and have it your way. Not everything is customized, and there are some limits to what you can do with things that. So, without further ado, here are some of the coolest ways you can personalize your home screen on Android.Personalize your home screen: Basics there are some simple settings for personalizing your home screen on Android that don't require you to download any new apps. First, and most obvious, is the wallpaper you use as a background. You can choose one of the set wallpapers, download some new ones or use your own existing photos. How to change your wallpaper on Android: Tap and hold empty space on your home screen. Click on Wallpapers at the bottom of the screen. Choose one of your existing wallpapers or use one of your own photos. Once you've made your choice, click on Set wallpaper. Choose whether you want this image as your home lock screen, or both. Repeat the process if you want different images on your home and lock the screen. (Note that some Android phones require you to pinch the screen to access home screen settings rather than a long push.) How to remove app shortcuts from your home screen:Click and app icon. Drag the app icon you want to hide in one of two places: the app drawer (represented by an icon at the bottom of the screen). Or to x at the top of the screen marked Delete. If you want to remove the app completely, you should see Uninstall next to Delete at the top of the screen - just drag the app icon there instead. How to add app shortcuts to your home screen: First, open the app drawer. Tap and hold the app you want and drag it up to the home screen. Throw it wherever you want it, and click and hold to drag it elsewhere. Drag and hold it at the edge of the screen to be taken to the next page. How to create an app folder: You can also create groups of apps on your home screen by combining similar apps into categories, each of which will have its own quick access folder: Click and hold appDrag it on top of another app and release. These two apps must be combined to a shared folder. Drag any other relevant apps into the folder. Click on the folder to open it and rearrange the order app by clicking, hold and drag. Rename the folder into something like Social, Messages, Games, or whatever. How to add/delete widgets: You can decide which widgets to have on your home screen. This process is almost identical to moving apps on and off the home screen: tap and hold empty space on your home screen. Click on the widgets at the bottom of the screen. Choose the widget you want on your home screen. Tap and hold it. Drag it into the position you want on your Android home screen. Personalize your home screen: Get a new Beyond home screen setup using what's already on your phone, you can also download brand new launchers that will change the layout and functionality of your home screen yourself. Launchers change the look and feel of even more parts of the Android OS, allowing you to make it truly your own. Launchers also allow you to change icons, helping to personalize your home screen to affect even third-party branding. Many launchers support gesture shortcuts and navigation, offer many more widgets and transition effects and can even learn your habits and adapt to your needs throughout the day. Custom Android launchers worth checking out include: Look at a few launchers and see which fit your personality best. Once you've found the one you like, install the app, open it and click Home. You should see a change notification default. Just change your default to a new launcher. If you want to change back (or you don't see a pop-up), go for customization and launcher searches - you should be able to find the right menu easily enough and then just choose the one you want from a list of installed launchers to make it the new default. Wrap There are many ways to personalize personalization home screen on Android, whether it's working with existing settings and options, or downloading new ones through third-party launchers. Have fun with the devices. Make them your own! What are some of your favorite ways to personalize your home screen? Have you found third-party apps that matter? Give us your feedback in the comments below!
