For some companies, outsourcing IT isn't just a cost-cutting strategy, it's a way of life. Take General Motors, for example. GM has contracted its technology work since the company cut its IT subsidiary, Electronic Data Systems, into a separate entity in June 1996. At at the time, GM signed a 10-year service deal with EDS. Over the years, the automotive giant also involved dozens of other major suppliers -- such as IBM, Hewlett-Packard, and Capgemini -- as well as hundreds of other major suppliers -such as IBM, Hewlett-Packard, and Capgemini -- as well as hundreds Managing contractors and setting IT strategies requires about 2,000 Information and Systems Services staff worldwide. When all the contracts expire this June, the IS & amp; Group; S GM decided to do things a little differently. First, it reduced the number of major suppliers for contracts worth \$15 billion from 18 to about six, and made them responsible for hiring and trucks, and truck Gage said. We shouldn't spend much time trying to manage tons of IT providers. To make it easier for things, every major supplier has been awarded a contract globally -- so GM can count on one resource for, say, all HR management applications or engineering job posts around the world. More importantly, GM creates a standardized work process in every region of the world. In the past, Gage said, contractors for IBM Australia may have handled different processes from their counterparts in Germany IBM or IBM USA. If GM wants to move workers from one region to another, they are forced to learn new ways of doing something every time. Under the new regime, each GM process is the same regardless of the region -- whether it's filling in purchase orders, managing network capacity, or comparing SLA. Another benefit? Execution speeds, Gage said. When we find a better way to do something in one place, we can roll it all over the world quickly. That helps us evict waste. GM also standardizes all touchpoints for each process, so all providers use the same interface to report information back to GM. When you grow as a company, you tend to have many different groups operating independently, Gage notes. To go to a global management structure you need to hon them all together. The more we drive the work, the process, and the infrastructure is standardized, the less complexity we will have.. Copyright © IDG 2006, Inc. From 1996 2006, the information technology budget and dollar agenda were cut by over a million dollars (Bartholomew, 2007). Due to these huge cuts, General Motors was forced to clogg up many tech responsibility companies in other countries. For the majority of the transition period, General Motors Motors EDS as a single outsourcing vendor. While this business relationship proved effective for General Motors and was able to remain in smaller allowable estimates, business agreements still proved to cost more money than organizations that should have been liked. Because General Motors is a global competitor and leader in its industry, the organization recognises that outsourcing to a number of different companies may be a smarter and more cost-effective option. Information technology companies began bidding for contracts with General Motors. With some companies offering competitive contracts, General Motors can reduce information technology budgets further and transform bigger profits. In fact, due to the cost of information technology being lowered, General Motors was able to upgrade to new software, new computer systems, along with the development and use of the system (Bartholomew, 2007). Despite reducing the cost of information technology is not the only transition made by General Motors, the changes made could boost profits for companies and operate at a global level at significantly lower costs. Global Communications, such as General Motors, also faces budget cuts and requires outsourcing to combine these changes. General Motors suggests a good example of how outsourcing can save money, and if a global presence is achieved, how outsourcing can be competitive and lead to profit growth. Global Communications should start researching different options for outsourcing. Although initially, they were only considering outsourcing to India and Ireland, other options may need to be considered if they are most cost-effective. If Global Communications can establish a presence among others, they may also be able to save money through outsourcing competition. Bartholomew's reference, Doug. (2007). Durant and Charles Stewart Mott. The current Chairman and CEO is Daniel Akerson. Akerson joined the board of GM in 2009 when the company was through bankruptcy restructuring. He became CEO Sept 1. 2010, and led the return of GM 2010 to the market - at that time the largest initial public offering in US history (Detroit Free Press, 2013). The headquarters for GM is now located in Detroit, Michigan. GM specializes in designing, manufacturing, marketing and distributing cars, trucks and Part. Brands under GM include Chevrolet, Buick, GMC, Cadillac, Baojun, Holden, Isuzu, Jie Fang, Opel, Vauxhall and Wuling. GM employs more than 200,000 people and has 396 facilities across six continents. GM is divided into five business segments: North American GM, GM Europe, GM International Operations, South American GM and GM Financial. The two biggest markets for GM are the United States and China. According to Dan Akerson they continue to do well in both markets and make further progress in their European business (General Motors, 2013). In July, 2009, GM filed for bankruptcy. Later that year, GM emerged from the Government-backed Chapter 11 restructuring. Then in 2010 GM made the initial public offering (IPO) which was one of the world's ... By Reuters StaffDETROIT (Reuters) - General Motors Co GM. N. a pioneer in outsourcing information technology, said it began reversing that trend with plans to at least double the number of internal IT specialists over the next three years. GM currently cloggs about 90 percent of its IT services and provides 10 per cent of the homework. Over the next three to five years, GM hopes to reverse those percentages in part by hiring thousands of new software developers, database experts and others around the world, GM spokesman Juli Huston-Rough said. The IT overhaul is led by GM Chief Information Officer Randy Mott, who outlined the plan to 1,500 GM IT employees in June. The IT services industry has grown in recent years as big companies bet that outsourcing computer operations will reduce spending and allow managers to focus on their core businesses. If Mott's strategy allows U.S. automakers to increase efficiency without increasing costs, it could be a blow to the industry as other companies might follow GM's example, affecting IT service leaders including HPQ's Hewlett-Packard Co. N, Dell Inc DELL. O, IBM IBM. N, Xerox XRX. N and Infosys Ltd INFY. Ns. Mott, a former HP executive, believes the measures will make the largest U.S. automaker more efficient, and ultimately more productive. Some elements of the overhaul will take five years to implement. If you're more efficient and you can go through the process faster, you have more time and more resources to see innovation that provides a competitive edge for the company, according to Huston-Rough. GM plans to cut its list of automaker IT applications by at least 40 percent and move to a more standard platform. GM will also simplify how it transmits data. A GM spokesperson declined to how many measures are planned will cost or overall cost savings that may result. Details of the planned measures were previously reported by Information Week magazine. The automaker will switch from 23 data centers worldwide to just two, both in Michigan. The company will also run four software development centers, including one in Warren, Michigan. Mott will also require employees to provide cost-benefit analysis of new IT projects and he plans to expand recruiting and hiring new college graduates. The measures reverse what has long been a trend for U.S. automakers, which received a government bailout in 2009 and filed for bankruptcy protection. In July 2010, GM signed a multiyear information technology contract with more than \$2 billion, renewing existing contracts a year earlier. HP said later it would provide services such as network maintenance, product software development and supply chain management. HP provided a lot of that work through its former GM unit, Electronic Data Systems, which was bought by HP in 2008 for about \$13.9 billion. HP declined to comment. GM bought EDS from former presidential candidate Ross Perot in 1984 for \$2.55 billion, shifting many IT operations to the business, but expanded it 12 years later. In July 2010, Capgemini declined to comment. IBM and Wipro could not immediately be reached. GM shares, which also announced a management shake-up in its European unit on Thursday, saw its shares close 2.9 per cent lower at \$19.33 on the New York Stock Exchange.
