Unlike computers of yesteryear and typewriters of the past, modern computers are packed with distractions. This week we want to hear about your favorite distraction free email app. Photo By Thomas Kwinet. The app in question can be on any platform, portable or not, even on a web-based basis, as long as it meets one fundamental requirement: it serves to block visual and/or sound distractions and help you focus only on writing. Hive Five nominations occur in the comments where you post your favorite tool to work with. We get hundreds of comments, so to make your nomination clear, please include it at the top of your commentary as well: Vote: Distraction-free app for email. Please don't turn on your voice in response to another commenter. Instead, make your vote and respond to individual comments. If you don't follow this format, we can't count your vote. To prevent falsification of results, votes from first-time commentators cannot be counted. Once you've made your nomination, let us know what makes it stand out from the contest. About Hive Five: The Hive Five feature series asks readers to answer the most frequently asked question we get: Which tool is the best? Once a week we will put out a call for applicants looking for the best solution to a particular problem, then you tell us your favorite tools to get the job done. Every weekend we will report to the top five recommendations and give you the opportunity to vote for what is best. For example, check out last week's top five domain names Registrars. A domain name magic that turns a raw IP address like 69.60.7.199 into a human friendly piece of More Cancer Data Registry data collection that is used for various research applications. Cancer registers collect data to identify emerging cancer trends in order to understand the factors contributing to this; investigate differences in health status in cancer incidence, prevalence, mortality and survival; understand care models in the cancer population; and to find out the impact of early detection and treatment on cancer incidence and outcomes. They provide important statistics to the public that may include individuals who are epidemiologists, researchers, public health planners, legislators, doctors and other health professionals, and more. Identifying new cancer trends as a first step toward understanding the factors contributing to cancer has a big impact on society in the United States and around the world, and statistics help us understand this impact. Using Cancers collected by cancer registers, statistics can be calculated to find out how many people are diagnosed and die from cancer each year, the number of people who currently live after a cancer diagnosis, the average age at diagnosis, and more. The incidence of cancer is the number of new cancers of a particular site/type, site/type, population during the year. The cancer mortality rate is the number of deaths, with cancer being the cause of death, which occurs in a certain population within a year. Identifying new trends from these indicators, among other statistics, may lead to further research to understand their underlying causes or factors. The National Cancer Institute provides access to various published reports on cancer statistics. For more information visit: A study of health differences in cancer morbidity, prevalence, mortality and survival of Cancer affects all populations in the United States, but some groups may carry a disproportionately heavy cancer burden compared to other groups. Differences in the burden of cancer are called differences in the health of cancer, which may include measures such as cancer incidence (new cases), cancer prevalence (all existing cases), death from cancer (mortality) and cancer survivors. Population groups may vary by age, disability, education, ethnicity, gender, geographic location, income, race and other characteristics. Through cancer registers, SEER collects data on cancer incidence and survival that aims to be representative of the racial, ethnic, and socioeconomic diversity found in the United States. For more information on cancer health inequality, explore the links below: Understanding care patterns in the cancer population Researchers can study cancer cases collected by cancer registers to understand care patterns in patient populations. This includes understanding treatment trends through site cancer (e.g. breast, pancreas) and treatment of inequality. The Initiative of the National Institute for Cancer Treatment (POC)/quality of care is an example of efforts to understand models of care among cancer patients. As cancer is increasingly diagnosed and treated in outpatient settings, the POC/Quality of Care initiative aims to study cancer therapies that are not well documented in hospital records. Based on cancer cases established by SEER cancer registries, studies conducted under this initiative provide national, population-based information on the spread of treatment to community practice, possible determinants of distribution and differences in therapy. This information identifies areas for educational programs. For more information on cancer treatment and care models, visit: Understanding the impact of early detection and treatment advances on cancer incidence and cancer outcomes collected by cancer registries can be analyzed using statistics to measure the success of efforts to and cancer management. These efforts include early detection of cancer and advances in cancer treatment. Although information on the method of detecting cancer cases (e.g. screening) is not collected by registries, researchers may indirectly indirectly changes in stage distribution in population cases that people with cancer have now detected previously. Early detection is essential for progress in the fight against cancer - some patients whose cancers are detected and treated early may have better long-term survival than patients whose cancers are not found before the onset of symptoms. Advances in treatment are fundamental to improving outcomes for cancer patients. Advances may include developing more effective and less toxic treatments such as targeted treatments, immunotherapy and cancer vaccines, or improving cancer treatments that have existed for decades, such as chemotherapy, radiotherapy and surgery. Cancer incidence and other statistics from information collected by cancer registers help to inform the public about the impact of early detection and treatment advances. To learn more about the opportunities and challenges of cancer detection and treatment research and the role of the National Cancer Institute in these areas, visit: Next section: ConsumerAffairs Resources is not a government agency.
