The GC-2014 series is equipped with advanced flow controller (AFC) technology inherited from gc-17A series and GC-2010 series. This digital control is not only standard for capillary columns, but also packed columns. Precise flow rate control through the AFC leads to a high level of retention time and peak area repetition, leading to a high level of analysis. The detectors have been completely redesigned, incorporating gc-2010 detector design for capillary analysis and GC-14 detector design for pack columns. This TCD-2014 unit is ideal for pack column measurements employing semi-diffusion cell design used in TCD-14. The newly designed FPD-2014 takes advantage of the hot-filament construction of FPD-2010. A large LCD displays chromatogram and method parameters. Graphical popup screen that clearly guides the operation to prevent operation errors. The built-in support function almost eliminates the need for familiar training. Validate that tool before self-diagnosis injections. Regular diagnostics prevents unexpected downtime. pillar Large columns are easy in the oven. Choose from five types of injection units and detectors according to the target compounds and analysis purpose. Modular injection unit, detector and auto injector can be easily connected after installing the unit in your lab. Three injection units and four detectors can be installed simultaneously. Effective use of valuable column resources is put in use of 40-mm pitch glass columns similar to the Shimadzu GC-7, 9, 12, 14, 15 and 16 series. Injection unit DINJ-2014 dual packed injection unit designed for dual aphid and TCD analysis. Because two flow paths are handled using a temperature control port, these count as a hot area. SPL-2014 Splitless Injection Unit Standard Unit for High Speed Analysis with a Narrow Bore Column. The Gas Saver function restricts the use of total gas. High pressure injection standard SINJ-2014 single pack injection unit is a special sample injection unit for use with it ECD or other high sensitivity detectors. The WBI-2014 direct injection unit includes septum pure flow path to restrict solvent tailing. Sharing glass inserts with splitless analysis simplifies the requirements (patents) of parts. APHID-2014 flame ionization detectors are automatic ignition and re-ignition function standard. Growing the APC or solenoid valve unit, a reaction function cuts the gas supply when the hydrogen flame is extinguished. Commonly used to detect organic compounds with hydrogen carbon bonds. Single and dual-fid. benefits
