Tweet In a tweet, Harrison Hoffman, senior program manager for Xbox officially announced the release of the Xbox app (beta) for iOS devices. This comes just days after the app was announced for Android users. The app has numerical fresh features, particularly a remote game that allows Android and iOS users to play any game installed on the Xbox console on their mobile device (s). You just have to make sure the Xbox console is on or set up with instant stand-off mode. This feature on iOS is a welcome surprise because Microsoft has previously failed to bring Project xCloud services into the Apple ecosystem. With the Xbox Beta app landing on the Apple TestFlight app, this spells good news for Xbox users who own an iPhone or iPad. It should be noted, however, that at the time of writing, the program (receiving 10,000 beta testers) has been closed for now and you will have to roll the next time it is available as soon as inactive testers are removed. Like the Android Xbox Beta app, the iOS version (support for iOS 8 or later devices) also comes with the ability to share screenshots of games and clips from the iPhone. Users can install games remotely along with other great features. Similarly, there is a single notification center to improve the user experience and the app interface has a modern look this time around. The final version of the application should have even more improvements as testers record errors, offers, and other inputs. Whether installing the game remotely will make it into the final app is still uncertain, given the strict apple App Store policies.
