The radius of the CircleA segment, which has one end point in the circle circumference and another end point in the center of the circle, is called the circle radius. Here, OA is the radius of the circle, having an O point in the center of the circle, and a point A on the circle circumference. Диаметр сегмента линии circleA, который проходит через центр круга, и конечные точки которого лежат на окружности круга, называется Диаметр круга. In the image above, AB, is a linear segment that runs through center O, and its endpoints (A and B) lie on the circle circumference. Thus, AB is the diameter of this circle. The circle circle is called the circle circle circle circle. The CircleLine chord, which has both endpoints in the circle circle circle, is called a circle chord. Here, AB is a chord having its endpoints (A and B) that lie on the circumference of the circle. Radius and Diameter (basic) Also on super teacher sheets... Brain teaser sheetsIn your students solve these brain septums? Mark Ryan When you work with circles, there are three straight components that you should be able to identify: radius, chords and diameters. Radius: The radius of the circle - the distance from its center to the point on the circle - tells you the size of the circle. In addition to being a measure of distance, the radius is also a segment that runs from the center of the circle to the point on the circle. Chord: The segment that connects the two dots on the circle is called a chord. Diameter: The chord that passes through the center of the circle is the diameter of the circle. The diameter of the circle is twice its radius. The above figure shows circle O. Related pages of The Tangent Of A Circle Chords circle The following figures show different parts of the circle: tangent, chord, radius, diameter, minor arc, main arc, minor segment, main segment, minor sector, main sector. Scroll down for more examples and explanations. Circle in geometry, the circle is a closed curve, formed by a set of dots on the plane, which the same distance from its center O. This distance is known as the radius of a circle. The diameter of the circle is a linear segment that passes through the center of the circle and has its final points on the circle. All diameters of the same circle are the same length. A chord is a linear segment with both end points on a circle. Diameter is a special chord that passes through the center of the circle. The diameter will be the longest chord in a circle. The radius of the circle radius is a linear segment from the center of the circle to the point on the circle. Multiple radius. In the chart above, O is the center of the circle and the radius of the circle. The radius of the circle are the same length. The radius is half the length of diameter. Doug Arc is part of the circle. In the chart above, part of the circle from B to C forms an arc. The arc can be measured in degrees. In the circle above, the B.C. arc is equal to $\angle BOC$, which is 45° . Tangent A tangent is a line that touches a circle only at one point. The tangent is perpendicular to the radius at the point of contact. The point of tangent is that the touchline is about the circle. In the chart above, the line containing points B and C has a tangent to the circle. It touches the circle at point B and perpendicular to the radius. Point B is called a dot of tangent. perpendicular i.e. the following video gives definitions of circle, radius, chord, diameter, sequential line, tangent, congruent circles, concentric circles and intersecting circles. The secant line crosses the circle at two points. A tangent is a line that crosses a circle at one point. The talking point is where the touchline touches or crosses a circle. Congruent circles are circles that have the same radius, but different centers. Concentric circles are two circles that have the same center, but the other radius. Intersecting circles: Two circles can intersect at two points or at one point. If they intersect at some point, they can be either outwardly tangential or internally tangential. Two circles that do not intersect may have a common external tangent or a common inner tangent. In the common outer tangent does not intersect between the two circles. In the common internal tangent intersects between the two circles. Sheets to calculate the radius of the diameter, diameter of the radius, or radius and diameter from the area or circumference. Diameter from radius, radius from DiameterDiameter or Radius from circumferenceDiameter or Radius from AreaDiameter or Radius from Circumference or AreaWhen first studying circles, many students often confuse diameter and radius. Although these two values are very simple, simple sheets that practice calculating one from the other can help consolidate that knowledge before moving on to more complex circle operations, such as area and circle calculation. Later sheets in this section require the student to work backwards from the area or circle to determine the diameter and radius of the circle. These are some of the earliest calculations that require a student to use a constant wee to solve problems. For manual calculation purposes, we expect 3.14 when solving these problems.
