Rejoice Android users! Facebook has finally rolled out an exciting feature for you (well... for many of you at least). Social media expert Ahmed Ghanem and consultant Matt Navarre shared the news about the latest addition to Facebook Android. Navarre tweeted that the social media giant was rolling out 3D photos to select Android devices. He also attached a screenshot of the official Facebook 360 announcement about the arrival of the feature on Android. Facebook 360 mentioned in its post that since the introduction of 3D photos last year and additional features with 3D photo creation from the Internet, users have enjoyed and fully used them, which is why now is the time to expand support for 3D photos so they can be incorporated into Android devices as well. These include Samsung Galaxy S9 devices, all S10, Note 8, Note 9, Galaxy Fold, Pixel, Pixel XL, Pixel 2, Pixel 2 XL, Pixel 3 and Pixel 3 XL models. For iOS, phones with support for 3D photos of the iPhone 7, 8, X, XS, XR, XS Max. In case you have any of the aforementioned devices, it's best to update the Facebook app to the latest version and then access 3D photos from the menu that appears after you decide to create a message. As can be seen from one of Navarre's general screenshots, the 3D Photo option can be seen along with other post-creation options such as photo/video, camera and feeling/activity/sticker, etc. Interestingly, the feature was rolled out just days after Snap Inc. announced its new Spectacles sunglasses, allowing users to capture 3D photos and videos. READ ALSO: Google Photos can now read the text in Lee's image feature reaches the same heights of success on Android that it has online and iOS will be defined in due course. At this point, it's a good time for Android users to enjoy sharing 3D photos on their Facebook timeline. Read next: Instagram is expected to be a platform full of advertising and no one is questioning it at all 23. August 2019 um 16:38 3D Photos are now available on Android. Since the launch of 3D photos last fall and additional features with 3D photo creation from the Internet, we've seen you adopt this new way of bringing to life your memories and moments. We're announcing enhanced support for 3D photos, including Android devices. Supported devices now include: Android: Samsung Galaxy Note 8, Note 9, S9, Note 10, Note 10, all S10 models, Galaxy Fold Pixel, Pixel XL, 2, Pixel 2 XL, Pixel 3, Pixel 3 XL iOS: iPhone 7, 8, X, XS, XS Max You can take 3D photos, a group or a ropes. Wenn du Problem beim posten eines 3D-Fotos hast, versuche es mit diesen Tipps. Now you can update 3D photos on Facebook without using your iPhone! Facebook has just announced two huge 3D Photo updates: Users can upload 3D Photos over the Internet (without having to use a mobile device) Android support goes into May 2019, meaning Facebook can take an image taken on some phone models and convert to 3D Photos on Facebook If you have an android device and want to download 3D Photos today (don't wait May!), the best way to do so is via web download. The article and video below shows both without requiring any depth to create the map. UPDATE 5/30/19: Extractor tool from the video above is now part of the OmniVirt 3D Photo Creator. Simply upload your photo taken on Android and the tool will automatically detect if your phone has depth data and extract a depth map. Try here 3D Photo Web downloads require the depth of the map To download 3D photos on the Internet, you need to download both the original image and the depth of the map, which helps create a 3D effect: Once you have these two images, Facebook allows you to drag and throw them into the status box on Facebook. Wait a bit for Togo to process it and you'll see a 3D photo. But it is not so simple: the most difficult thing is the preparation of a depth map. This image is very important because it stores information about the depth of the image (hence the name). You can create a depth map on Photoshop, but it requires some know-how. Our tool will help you extract deep maps from your Android images We have come up with a way, Help you extract a depth map from images without Photoshop required, especially for devices that store depth data. How is that possible? Some mobile mobiles You can take a photo with a blurry background like the iPhone and Huawei in aperture mode and Samsung Live Focus. This type of image already contains information about the deep map. It's easy to say your picture is actually very ready to use. You just need to add one step: extract a depth map. Our tool does just that: it will extract a depth map from an image taken from a supported device. You can then use this depth map to upload 3D photos to Facebook. What you need: Samsung Galaxy device that can take Live Focus images, Huawei device that has aperture function, or Google Pixel, which can take portrait images; or another device that takes images with depth of computer data © How can I know that my photo can be provided on my phone? The easiest way to check is to open a photo on your phone and look for a button that says: ADJUST BACKGROUND BACKGROUND BLUR. This confirms that your image contains deep data that our tool can extract. If not, try checking your picture on the tool. If it can't detect depth data, the tool will let you know. How do I upload a 3D photo to FB? This part is simple! 2-3 clicks per mouse and you're installed. Send the blurry image to your computer without compressing it. (You can do this by emailing or directly copying a file from your phone. Please don't use Facebook Messenger or Whatsapp, or you'll lose information about the depth map) Open 'OmniVirt 3D Photo Creator' and select the image from Step 1. A tool with detection if your phone has the depth of data stored. If this happens, it will automatically remove the depth map. Remove the .zip file, then drag these 2 images and drop them on the FB mailbox. Here you go! Your 3D photo is ready to be shown. Follow OmniVirt to find out when other devices will be supported. Mention @OmniVirt in your 3D photos! After tagging the expanded Android rollout back in April, Facebook this week officially announced that its 3D photography option would be available on Android devices, and an expanded set of iOS smartphones. Facebook's 3D photos, which add depth to more images using the dual-capacity camera of most modern smartphones, provide another creative option for your Facebook posts. And Facebook's more advanced visual formats have already proved popular - Facebook reported last year that more than 70 million 360 photos had been uploaded to the social network. Facebook continues to increase its 3D photo options over time, adding desktop support, the ability to post 3D photos in Stories, on Messenger, and now, through Android devices. As you can see on If you want to post a 3D photo, you can choose the 3D Photo option from the update tool list. This is another option to consider - and certainly 3D messages can help stop scroll and capture people's attention in channels. Facebook has a new feature that uses machine learning to turn any ordinary photo into a 3D image that consider from different angles if you tilt or rotate your phone, or scroll past.3D photos have been around for a while on Facebook, but so far it's only been possible to post one if you have a phone with a dual camera that can capture two images and create a depth map. The new tool uses machine learning to extrapolate the three-dimensional shape of objects in an image and uses it to create a convincing 3D effect. It can even be used on decades-old images, and it works on any mid-range Android or iOS running phone. (Image credit: Facebook) Make Facebook 3D photo.Launch app Facebook and click What's on your mind. Scroll down and click '3D photo'. Choose a photo and then wait until it is processed. Preview the 3D effect by moving the phone. Add text and any other content to your post, and then click 'Post'. Tips for improving result! effect is pretty convincing, but the app can't create new data that's not yet in the image, so it will extrapolate what the area behind the image object will look like based on nearby pixels. Sometimes this leads to a background that looks a little blurry, so it's best to avoid intricate patterned backgrounds. Facebook says the tool works best if you avoid images with narrow objects in the foreground, or with lots of reflections. It is also a good idea to select images with objects at different depths for better effect. Facebook is currently working to make 3D photos created in this way even more compelling, so we look forward to seeing an even more impressive version in the future.
