Chainsaw is a versatile tool for milling trees and making some really exceptional result out of it. I have a friend living in New Mexico who does a wonderful job of creating elegant pine pieces. Cutting logs into wood with a chainsaw and making it beautiful plus sturdy can give you extra money making the way. With the chainsaw mill, everything will become even more interesting. If you don't have one, don't worry! There are different models of chainsaw mills that come to the market today with excellent features. You can DIY your own handmade chainsaw mill guide to the rails, which is our topic today! DIY Rail Guide! It's not complicated, so don't worry. I'll try to be as simple as possible about every step. Make sure you read through carefully. Just like that! Know what items you need! When I was in the topic of learning more about having chainsaw mill rails, someone told me that the stairs make excellent. Yes, amazing hardware store conventional stairs can give a good setup as a rail guide. But some may not want to spend more than a hundred on the stairs just to use it as a railway installation. Thus, one of the available options is to get a power rack. You can easily find them in the oversized hardware store section. You can grab ten pieces, three of them will suffice. Just slice one of them into six pieces measuring 1' like a crossbar and two 2' incisions for the end of welding. Now the remaining two must be used to structure the setting. Bonding! It's time to create some connection between the parts you just cut out. Get the welder to work to go smooth. You have to grind the edges of the cut as well. Attach two steel sticks is not difficult, but a little difficult. Maybe you can take the help of your welding buddy for this. You can't go wrong to do it yourself, but in case. You have to make cross braces so you tick off the holes. Make sure there is a two inch interval between the holes. You should follow some pattern for welding brackets. Also, get some ratchet or socket combinations for fastening. You can also use a chainsaw tool for this. Creating Rail! You can simply use large bolts using a chainsaw and make rails. To fasten the rail and brace structure, use two chainsaw tools if possible. Just place the tool at the end of the channel. When you compress it, you need to replace the bolts again. Make sure all your equipment is in the right place and then go for a tightening. It will also help if you clamp slowly in advance. Give yourself some time to square one side for cross pieces. This is To finish the other side better and faster. Almost done! You need to align and space the rails from one end to the other. Use the mounting block and screw it. A one-inch block will be enough for the interval. For rail and brace attachments, I went for four half an inch long screws. Carefully adjust these screws. They don't have to be piercing in your cutting plane. You need to. Check the surface to align again. Make sure all ends are pretty fixed. Verdict! Once you have a DIY version of the rails guide now all that's left to do is learn about how to use a chainsaw mill. These DIYs are really easy to try for budget conscious folk, but professional versions will always serve better. So, if money isn't the only thing that matters to you, get good quality rails for chainsaw milling is a chore. I hope you will have many successful projects ahead, GOOD LUCK! Jacob phelpsomitch Messages: 9 Posted 2 years ago BY CASHHubbard is a martial arts master and freelance photographer living in the mountains of New Mexico. Turns out you don't need to buy stock rails for chainsaw mills after all. Photo Dejan Sakic at Unsplash! In The Mountains of New Mexico, pine trees are a sophisticated but elegant material to work with. The thick bark makes cutting trunks exceptionally difficult, but the result is exceptional: After cutting, the pine boards are both beautiful and sturdy. I ordered my Alaska chainsaw mill so I could mill my own wood for projects that include an indoor porch deck with a ramp for my father, a Mexican-style shade structure, and a back deck porch. In this article, I detail how making homemade rails for granberg Alaska MKIII chainsaw mill with the following information: Identifying welding materials Finding the necessary bolting bracket equipment for the rack to make rail wood cutting using the Rail Portable Saw Mill can simplify the difficult work when dealing with wood in the desert. Kevin through Flickr Mill, where wood is cut down for use for construction and construction. Necessary lumber reductions for my projects! need mills: 1 flooring 2 x 6 boards 6 x 6 message corbel blocks 6 x 8 beams After doing some comparative price research, I decided to create a rails to slide the mill apparatus out of good straight lumber instead of buying rails. Creating rails for my Granberg Alaska MKIII Chainsaw Mill! After getting a mill I decided I didn't want to risk milling bad lumber, so I made my own 12' rails. That's how I made the rails for less than half the cost of manufactured 9' rails recommended to purchase with Granberg Alaskan MKIII chainsaw Mill. 1. The definition of proper Materials! was in the store looking for a ladder because I saw that someone was using half the extension stairs as rails for their chainsaw mill. I had to grind 10' logs, so the rails should be longer than the log. I was looking into buying 24' stairs so I could use the 12' section. At \$150 a pop, I thought it would be a waste of a good ladder and I felt cunning. as they don't keep ladders in the aisles, I found exactly what I needed while snooping around the back of the store where they keep too sized things. Power racks are used as a metal frame for electrical, HVAC and other works. I bought three 10' 10' and cut one of them into six 1' crossbars and two 2' pieces to weld at the ends of the remaining two 10' power racks. 2. Welding Power Struts! Don't forget to grind the rough edges! It's nice to have a welder when you need to attach two steel sticks together. I usually hire my buddy to do my welding, however, I can make a couple of ugly welds that hold! Tick the holes for a cross brace. The holes in the power support channel have 2 intervals in the center. For perspective, a cross brace at the ends posted 1 foot from the end to miss six holes. The transverse pattern of rails and cross braces requires seven braces when building rails from the power rack. Made with Sketch.io! The template holes and Weld! It brackets are useful to weld brackets in a template. I welded the rails on the next picture. The chart above also details where I placed the brackets on the racks. X - Cross brace 6 holes X 11 holes X 10 holes X 11 holes X 11 holes X 6 holes bolts needed to create the rails. 3. Equipment for the construction of Rails! use large bolts that can be welded with the most common tool every sower has: a chainsaw tool! Don't forget the muscular pucks and nylon locknuts. Rails can be adjusted to be closer together for small logs in place, I can only imagine doing it with hardwood, otherwise, skinny trees are not worth milling. DIY Chainsaw Rail Price Breakdown! Item u'uity Price (each) Price Total 10' Power strut 3 \$20 \$60 Hardware (1 5/8 bolt, two washers, two locknuts) 12 Sets \$1.25 \$15 Time for two welds, edges grinding, and bolts 3 Hours Free! Priceless value: \$754. Bolting braces for Struts to make Rail! Two chainsaw tools work well for bolting together rail and brace racks. You will have to slip each tool into the ends of the channel and replace it with each bolt again as you squeeze it. I installed all the equipment in place before tightening; Then slowly clamp down before mounting. I took the time to square all the cross pieces on one side, then do the other side went very quickly. The 12' Rail Finished Product! Mounting Blocks for your Rails! Screw and level (side-to-side) mounting unit then add 1 block to space it and level the rails from end to end. I used four 1/2 long screws to attach the rails to the braces. Adjust the screws and the vual! Make sure they don't penetrate your cutting plane. Check the surfaces to make sure they are on a level. Check again after each end is fixed, and check a third time to be sure. For my magazines, I aligned my trailer with a blocked magazine center, so I didn't have to make adjustments with minor angles. Blocks Supporting rail braces Chainsawing shoes and using small slots proved to be the best method for perching my rails on the log. On cone-shaped logs, the use of a small interlude block at the end of a smaller diameter helps eliminate the crossing of grain from end to end. Of course, the incisions at the thick end of the end Enough to be level with a small end and will require cross-cut shoes for the second and/or third cross brackets closest to that goal. Checking the level from side to side at both ends is crucial for the level cut. Pre-Cut! 5 log and rails. Fraser tree with new rails! Post the first cut and shimming keep it from pinching the saw. For the first cuts, I found that shimming is not as necessary if you're going to plane boards as I'm going to do. When milling bead-sized cuts, heavy slabs should definitely be shimmed as you go. At the top of the magazine Lopped Off! Staining boards are a different story. Treat your new tips To treat this lumber with Cedarshield then stain with a beautiful red stain. This wood will soon be torn for flooring. Add a little photo of the material of the decking finish and the completed deck soon! Do you have a chainsaw mill? Are you making your own rails? Did you try to build those rails? I'd love to hear about it! Leave a comment below. This article is accurate and true to the best of the author's knowledge.
