Bitzenburger fletching jig was the industry standard when it comes to fletching tools. This true-accurate fletching tool is widely used by manufacturers of quality shooters around the world. Get Bitzenburger Jig and clamp on custom 60X strings and enjoy unparalleled quality along with superb design, simplicity and reliability. Get almost every fletching feature that you would like with this high precision jig. Excellent Fletching combinations This self-supporting fletching tool is made of solid alloy and has a strong permanent magnet that allows for the uniform placement of all types of feathers and blees. Adjust the angle of the stain easily for a few seconds, with large magnet holder dials at both the top and bottom. Whether you want to produce straight or offset spots or fleck a few feathers in different angles, Bitzenburger Jig offers excellent combinations. The all-metal design of bitzenburger fletching jig easily takes any shaft. It includes a clamp, wrenches and instructions. Self-centric receiver Self-support jig and clamp Fletch straight, offset, true right helical, or left helical Flexible and adjustable pen intervals, held at a 45-degree angle to provide a clear view of fletching each time you buy high-quality deliveries Want you to improve the accuracy of firing or customize the bow to improve performance. 60X Custom Strings has a wide range of supplies and bowstring accessories. Shop different brands to find what you need for your bow compound, longbow, or crossbow. Contact us to place orders and enjoy a one-year warranty. © 1996-2014, Amazon.com, Inc. or its Affiliates Review by Steve Jan 18, 2019 Home shooting zgt; martin J8 Fletching Jigcarbonate fletching Jig Martin Archery, more popular in the States than in the UK, quite possibly because the traditional style of field shooting is more there than here. I don't think I would be thanked for it, but it's a plastic, budget Bitzenburger. That is that it is cheaper and will do everything that Bitzenburger will do before and including making Bitzs clamps, the clamps it comes with polycarbonate too and are available in the usual straight and left or right helical. The reason I mention it is because I'm not a fan of polycarbonate clamps - I try to be as neat and tidy as I can when fletching arrows and in order to get the finish I want it to be necessary. Having said that, it is almost inevitable that some glue will find its way to the clamp at some point, and when it does it will be difficult. You can buy all kinds of tape to prevent glue from getting on the jig, but I never have to clear the glue from the clamp you need a knife and this is where the problem can The plastic clamp will be more susceptible to damage than a steel or alloy one. The ability to take Clips Martin's shrewd move as the Bitz clamp is a sturdy rugged thing. As for the ease of use it's just like any jig, it works on the magnet principle and there are regulators on top of the jig to fine-tune offset or helical angle, it's big screw nuts and make life a little easier than Allen's key on Bitz. It will fletch 3 and 4 fletches, there are also mounting holes in the base, so you can screw it onto the board if you want a good idea as it is much easier than Bitzenburger. Despite the price, in my opinion, Bitz is a better jig, although Martin Jig with Bitz clips will save a few dollars. Verdict He does all the things Fletcher demands from Jig, but, polycarbonate just doesn't do it for me. The performance I prefer it when using Bitz clamps for poly ones it comes with, I can't argue with the fact that it works well. Value for money Offers value, given that it's about \$30 cheaper than Bitz Overall It's a plastic Bitzenburger at half the price, there will always be archers on a budget or looking to save a few dollars and if you really want Bitz but just can't afford one then this is an alternative. If you can afford one Bitz or 2 of them, then you will have to make that choice... I know what I'd do. Discussion Starter and #1 August 2, 2016 Hello, I recently bought a pair of used Martin J8 jigs. However, there are no directions. I haven't fletched arrows before and need directions. Do you have any body kit that perhaps they could post or email me? That would be fantastic. I called Martin and was told they had not done them for several years. She didn't offer to check around. I guess they have instructions in PDF form but it wasn't going to look. I hope someone in the community can still have instructions. Thank you. - I have the same jig and I've been using it for 40 years and I'm looking at it right now. I have straight and right helical jigs. With a straight line, you can get just that or a big off-set. Right helical you can get up to a very spiral vane. I still have the original plastic packing bag that it came in in. There may have been a bit of a bang chart that shows the composition of the end that the noc fits in. I have two fittings, one on three flutches and one on four flutches that will give you vans that stagger at I think 30 and 150 and 210 and 330 degrees. I don't want to pull mine apart because I'm set up for helicals right now and I don't want to risk anything changing. I'd start by playing with him. Loosen the thumbwheel setscrew and remove the screw at the bottom. This will give you a general idea of the nuts and bolts. There are two round, knurled threaded which you tighten as soon as you have magnetic magnetic Properly positioned to take the jig that keeps in the van. I always glue one van to make sure it makes good front contact on the back before proceeding to more. If any adjustments are needed, I'll clear that dip, tweek it a bit and try another. I don't think I've ever been tweek it more than once. If you don't get good contact along the entire length of the van, it's because you don't have a jig properly positioned on the arrow or you're going beyond the jig capabilities. These jigs were made before computers and computer files were commonplace. I don't think she's out of your way. I hope it helps. - Discussion Starter and #3 August 3, 2016 Thank you Conquestador, sounds like good advice. I started playing with him last night. In addition, Kate in Rose City archery opened a new box in his store and sent me a copy. That's it if anyone else is watching. Happy shooting. - Where is? No links are attached. I'd like to see him. Maybe I'm missing something. Thank you. - Discussion Starter - #5 August 4, 2016 Sorry, didn't understand how to post it. I thought I could just trudge and fall. When I get the chance, I'll see it. - Discussion Starter and #6 August 4, 2016 PDF is 0.09 MB too big. I could email to you. - Thank you jholt, highly appreciated, but I don't think he'll tell me anything I haven't been able to figure out. You won't set any speed records with it, but adjust properly it does a great job. - Discussion Starter - #8 August 8, 2016 I don't think you would have learned anything new. It's not hard to understand, you're right. Jig bases should be installed on a board or counter using holes provided at the bottom of the base. (Fig1 A) Note: #10 wooden screws. Insert the nock into the right position in the nock (Fig1 B) receiver. If you don't use adjustable nocks there are six small lines located on the jig dial (Figure 2 G), 3 longer lines and 3 shorter lines. Three of these lines are shown in (Figure 2 G). The plate you set in the jig will determine which lines you will use to align the pen. Relax the Nok adjustment handle (Fig1 F) and rotate the fig 1 G dial until the corresponding lines are visible (Figure 2 G). Then moving the jig dial left or right to the middle line on the jig dial and the jig-based search line (Figure 2 A) are alien (Figure 2 red arrows). If you can't get them to align properly, then rotate the dial to the next set of lines and repeat the process. Once you have completed this, block the fletching plate adjustment handle (figure 1 F). This step is not necessary for 4 X 90 Fletching or adjustable nocks. The nok adjustment pen (Fig1 F) should be locked in position until Gluing. Note: Adjusting handle (Fig1 F) allows 7 degrees to compensate each side of the pen for the starting position, this may be to line up and repair old arrows. Repeat the process from 11 to 15 until the arrow is complete. From \$19.90 Hurry! Big Save is coming to an end soon. Don't miss the hot savings. This itemWe aim to show you accurate product information. Manufacturers, suppliers and others provide what you see here and we haven't checked it out. Support the arrows with Martin Fletching Jig Straight J8S. Thanks to the modern design, this jig will look stylish, giving a reliable performance. Arrow fletching jig is made of durable injection molded poly carbonate for solid reliability. It offers interchangeable discs for three or four fletchs for your convenience.
