GuY has a problem with android studio. I make a screen splash in the Manifesto, then I run the app in the app name app app srenshot emulator. ScreenShot1 Screenshot of the app_name Time Settings title_activity_splash action_settings Tables I want to change the name of the project in Android Studio. I found some answers on Stackoverflow, but it didn't work for me. Please offer me a solution. I currently use Android Studio 2.3. Thank you always :) Sometimes we make our app using code from YouTube tutorials and blogs and can forget to change the name of the package at the beginning. Yes, it happens most of the time. We do not want to display other website names or Youtube channel name to be as our package name, We want to name the package that defines us. If you are looking for a tutorial on how to change or rename the Android package name in Android Studio, then this post is for you. In this post, I'm going to discuss 3 methods that I use and still works. Method I - How to rename android app package name in Android Studio In this example we will change the name of the package com.androidride.myapplication on com.xyz.yourapplication. Step 1 Outdoor Android Studio Project, Select Package Name or Java. Click Gear Icon. STEP 2 Deselect Hide empty middle packs. This breaks the structure of the folder into pieces. The package will be washed away. Step 3 Right Click on AndroidRide, Refactor - Refactor - Rename. You can also use Shift and F6. There will be a warning. STEP 4 STEP 5 Clear AndroidRide and put a new name in it, here xyz STEP 7 Repeat the same process. Click the right button on.myapplication, rename and rename. Step 8 Change.myapplication to your application STEP 9 STEP 10 After changing the name of the package, open build.gradle (module) and change the application Id STEP 11 to change applicationid com.androidride.myapplication at com.xyz.yourapplication. After the applicationid change, click on the synchronization now. Congratulations. The name of the package has been successfully changed. Method 2 - How to change the full name of the project package by creating a new package In this method, we are going to change the name of the package com.androidride.myapplication at info.xyz.yourapplication Step 1 Right click on com.androidride.myapplication package and select Refalic-gt;Move STEP 2 Select Move package com.androidride.myapplication on another package. Step 3 Now you get a dialog alert showing multiple directories match the com.androidride.myapplication STEP 4 package enter a new package name, except for the last level, for example. If you want to make the package name as info.xyz.yourapplication, then enter info.xyz only as Above. Avoid the last part, here's your application. Click YES to create a new package. Step 6 Click Refactoring. Now the name of the package com.androidride.myapplication is changing to info.xyz.myapplication. Step 7 Now we have to change the last name of the package level, Right click on the name of the package - Refactor - re-name STEP 8 STEP 9 Rename.myapplication in your applique. STEP 11. Use the CTRL key and select each package associated with the old package name and remove it. You can use the DELETE key in the keyboard or press the right button after selecting old packages and click on the remove option from the menu. STEP 12 Open build.gradle file, change applicationid and click on synchronization now. The name of the package has been successfully changed to info.xyz.yourapplication. Method III - How to rename the android app package name in Android Studio using the existing package This method is also the same as the second method. Just like secondly, we change the name of the package com.androidride.myapplication to info.xyz.yourapplication. Step 1 Right click on Java and select the new zgt; package The next dialog box appears, select... app/src/main-java as a destination directory. STEP 3 Enter the package name, here info.xyz.yourapplication STEP 4 Now move the old package files to the new package. Here, move the files from com.androidride.myapplication to info.xyz.yourapplication. Just use the CTRL key to select all the files and drag it into a new package. STEP 5 Open AndroidManifest.xml and change the name of the package to info.xyz.yourapplication. STEP 6 Open build.gradle (Module: app) file, applicationid change as well. Change it to info.xyz.yourapplication and click on sync right now. Now you can get bugs. This is due to the import of R-files. There are two scenarios we can do. Remove the R line of import from both files and check the error is still there. If not, you can delete old package files now it's done. You have successfully changed the name of the package. Otherwise, if the bug still exists, take the steps below. STEP 7 Select the R file import line just like the above and click CTRL Replace the new package name. Click on to replace everything. STEP 8 STEP 9 Remove the old package and related STEP 10 files Yes, the name of the package has been changed. Express your thoughts below and tell your friends about this post. 感觉Android Studio挺强 但在使用的过程中 发现有不少和Eclipse不一样的地方 还需慢慢适应。 其在Android Studio修改 package的名称好像比较麻烦。 如图所示 如果通过右键package.refactor.refactor,只能修改最后级的包名。 而我希望把com.example.webviewdemo间的e给去掉。 方法如下: 1. 首先,新建一个package.命名为我们希望的路径和包名,这里就是com.webviewdemo。 2. 修改manifest文件。 打开manifest. 光标置于packing... 上 按下 shift - (fn) - f6,就会弹出下面的提升框,我们将其改为com.webviewdemo。 3. 修改R文件所在的包。 在packing f6, we'll move the R file to com.webviewdemo. You will then find that the R file ran to the com.webviewdemo package of source code and be sure to delete it (otherwise the compilation will have a class to repeat the error). However, the purpose of this should be for all links to the R file to be changed accordingly. 4. Drag files from the source code com.example.webviewdemo into the com.webviewdemo package. Finally, please note that the entry into the main activity in the manifest file must be changed accordingly: android:namecom.webviewdemo.MainActivity 5. Compilation, launch and operating box pop up. We check the launch in the active module of the operating box and find the main activity under the new package. Run... Continue anyway ... That's it. If that's not normal, don't forget the project (Build a headline bar called Clear Project or Build...) or restart Android Studio. (It seems that a reboot is necessary, otherwise it will report an error, bullets) Android Studio change the name of the package so troublesome, I hope this mindless tutorial can quickly help everyone. Lately for the demos have just started to bind Android programming, there are many basic knowledge is not solid, the principle is not very understanding. Please point this out. Help: I use Android Studio 3.4 and I would like to copy and rename (clone) one of my existing projects and reuse it under another. The name of the project. I tried to change the name of the package and refactor it, but I somehow stuck. Do I have to manually change Gradle files? Do I need to manually modify the AndroidManifest.xml file? A step-by-step guide would be very appreciative. On the one hand, I strongly recommend an update to the latest Android Studio (0.3.7 at the moment); There are tons of bug fixes. You're working with a error, which is that if you're trying to use the user interface to rename modules or your project, it doesn't update the build files. Sorry, now it's really broken. I suggest changing directory names directly to the file system and updating the settings.gradle file to reflect the changes. Your project on the drive should look like something like this (with a lot more files than what's shown here): projectFolder s---settings.gradle s--- applicationModuleFolder s build.grad.gradle s---src it uses the project Foldfolder name as the name of the project and applicationModuleFolder as the name of the Android Apps ally model). I think that's how your project Now, they both have the same name; You can rename both the same new name if you like, or you can give them different names. Never mind. Once they are renamed, edit the settings.gradle file: it will look like this: turn on ' applicationModuleFolder' just change the name to a new one. New. It's the same. After making these changes, click the Sync Project button with the Gradle Files button in the toolbar (if you're using a very old version of Android Studio, it may not have that button, so you can close the project and reopen it in this case) and it should pick up the changes. Page 2 I want to change the name of my project and module. But if I try to rename them Android Studio notify me some errors. ... for example, I want to change the name from MyApplication to AndroidApp, as shown in the picture below. In the first rectangle I want to change it in: AndroidApp (G:...AndroidAndroidApp). In the second rectangle I want to change it in: AndroidApp (AndroidApp-AndroidApp) edit: This is a magazine: Gradle: The 'AndroidApp' project is not found in the root project 'MyApplicationProject'. build.gradle: buildsript - repository - mavenCentral () - additions - classpath 'com.android.tools.build:gradle:0.5.' - apply plug-in: android repository - mavenCentral () - android - compileSdk Version 18 buildToolsVersion 1 8.0.1 defaultConfig - minSdkVersion 7 TargetSdkVersion 16 - dependency - compilation 'com.android.support:support-v4:18.0.0' - settings.gradle: include 'MyApplication:MyApplication' bachna ae haseeno mp3 song download wapking. bachna ae haseeno movie mp3 song download wapking
