PHP is a very supportive programming language and provides developers with several ways to download a file from the URL using PHP. I'll show you how to do it in PHP. Download the file from the URL in PHP In general, as far as I know, there are three ways to download deleted files from the Internet, and they can be made by: Using fopen() Using file_get_contents() Using the cURL module. We will go through each method right under. Method 1: Using fopen() According to PHP documentation for fopen, entry in the form of scheme:// for a list of supported protocols, and it includes http, ftp, file, ssh2... This means that we can use fopen to access any file submitted to web servers. This is an example of using fopen to download a file from a remote URL. const BUFFER No 1024; download function (\$remoteFile, \$localFile) - \$remote - fopen (\$remoteFile, 'rb'); \$flocal if (!\$remote) - the return of \$localFile false; 'wb'); If (!\$flocal) - fclose (\$remote); Return is false; - while (\$buffer - fread (\$remote, BUFFER)) - fwrite (\$flocal, \$buffer); - fclose (\$flocal); fclose (\$remote); The return is true README.md After opening the reading thread with the fopen, we have to create a stream of emails to save the file to the local, as you can see from the code above. Method 2: Using file_get_contents function () Like fopen(), but instead of processing manually to get the deleted contents of the file, creating file pointers, the function of file_get_contents() will do it for us, it reads all the contents of the file and stores in a row. And we can write that line down in a local file. \$contents - file_get_contents (; file_put_contents (README.md, \$contents); Compared to method 1 using the fopen, using file_get_contents () is shorter and faster. However, you should only use this feature if you know that the deleted file is a text file. If the deleted file is a binary file, you should use fopen. Method 3: Using the cURL module is the official supported PHP library that helps make requests and process responses to the server. There are 4 steps to use CURL. Init copy of cURL. Prepare the copy options. Make a request. Cleaning. To download a deleted file from the URL, this is basically what you need to do: \$ch and curl_init (); curl_setopt (\$ch, CURLOPT_RETURNTRANSFER, really); curl_setopt (\$ch, CURLOPT_SSL_VERIFYPEER, false); \$response - curl_exec (\$ch); curl_close (\$ch); file_put_contents (README.md, \$response); Let me explain the two options used in the code. CURLOPT_RETURNTRANSFER: it will do CURL to return the contents of a deleted file. CURLOPT_SSL_VERIFYPEER: disable the handshake SSL and check. Which one should I use? It depends on your situations. Curl Curl perform both fopen and file_get_contents, this is for a common purpose when you need to configure many options for download, such as: providing SSL verification, request with basic authentication... CURL is an additional module in PHP, so you need to include the CURL module in the php.ini file for use. In addition, a cURL instance cost more memory and duration of initialization before making the request longer than using the other two features. If you want a simple and easy method of downloading a file, use fopen or file_get_contents. Make sure to cope if mistakes happen. As you can see, it's easy to download a file from the URL and save locally using PHP, and it's all depending on your situation to decide which one to use best. The entire demo code for this tutorial is stored on Github, check it out if you have any problems with the code. Have fun! 9 months ago zaid bin Khalid 4861 Views 3 In this post, I'll try to explain to you how you can download any file on his URL using PHP. You can do this in many ways, but in this tutorial, I'll explain to you a few tricks. First method We will file_get_contents() built-in function PHP. This feature is similar to the file () see the only difference file_get_contents () returns the file in the line. This feature uses memory mapping techniques, and it's the preferred way to read the contents of the file. file_get_contents (line \$filename, bool \$use_include_path - FALSE, resource \$context, int \$offset 0, int \$maxlen) : line function returns reading data or FALSE when failure. \$url and \$urlPdf and \$file name and \$url name; Save the file using the base name if (file_put_contents (\$file name, file_get_contents (\$url) Another Echo File download failed!; ???The above feature will save the file on the same path where you run the PHP script. If you want to download the file in the right place, then you need to install some blanks. That's why I'm writing the feature below that you can use to save the URL of the file shape in the local system. df (\$urlFile) function \$file name and base name (\$urlFile); Save the file using the \$fn and file_put_contents's base name (\$file name, file_get_contents \$urlFile); Title (Expires: 0); title (Last changed: gmdateD, d Y H:i:s). GMT); title (Cash control: no-shop, no cache, must-returnees); title (Cash control: post-check-0, pre-check0, false); title (Pragma: no cache); Title (Content type: app/file); the title (Length content: 'filesize(\$file name)); Header Attachment file name '.basename (\$file name)); readfile (\$file name); ? <?php \$url \$urlPdf df (\$urlPdf); ?> Второй метод. В этом методе, я покажу вам, как вы можете скачать файл с helo CURL другой встроенной функции PHP. Если вы используете ниже функцию вы можете сохранить файл непосредственно в вашей системе, давая желаемое местоположение. <?php функция dfCurl (\$url) \$ch - curl_init (\$url); \$dir './YourDirName/'; \$fileName - базовое имя (\$url); \$saveFilePath - \$dir . \$fileName; \$fp - fopen (\$saveFilePath, 'wb'); curl_setopt (\$ch, CURLOPT_FILE, \$fp); curl_setopt (\$ch, CURLOPT_HEADER, 0); curl_exec (\$ch); curl_close (\$ch); fclose (\$fp); ?> Использование вышеуказанной функции приведено ниже. \$urlPdf - ; dfCurl (\$urlPdf); Вы можете использовать любую вышесказанную функцию для загрузки файла в систему или на сервер. 9 месяцев назад Заид бин Халид 4861 Просмотров 3 Я использую это для загрузки функции файла cURLcheckBasicFunctions () - если (!function_exists (curl_init curl_close function_exists curl_exec function_exists curl_setopt function_exists) ! Можно изменить на типы возврата int или bool. функция cURLdownload (\$url, \$file) - если (!cURLcheckBasicFunctions()) - возвращение UNAVAILABLE: cURL Основные функции; \$ch - curl_init (); если (\$ch) - \$fp - fopen (\$file, w); если (\$fp) - если curl_setopt (\$ch, CURLOPT_URL, CURLOPT_URL) \$url) - fclose (\$fp); // в матче с фоном () curl_close (\$ch); // в матче curl_init() возвращение FAIL: curl_setopt (CURLOPT_URL); ini_get ('open_basedir') - ini_get ('safe_mode') \$redirects < 1) - curl_setopt (\$ch, CURLOPT_USERAGENT, 'Mozilla/5.0 (X11; U; Linux i686; ан-США; rv:1.8.1.11) Gecko/20071204 Ubuntu/7.10 (gutsy) Firefox/2.0.0.11'); curl_setopt (\$ch, CURLOPT_RETURNTRANSFER, 1); curl_setopt (\$ch, CURLOPT_REFERER, ; если (!curl_setopt (\$ch, CURLOPT_HEADER, \$curlopt)) вернуть FAIL: curl_setopt (CURLOPT_HEADER); если (!curl_setopt (\$ch, CURLOPT_FOLLOWLOCATION, \$redirects > 0)) возвращение FAIL: curl_setopt (CURLOPT_FOLLOWLOCATION); если (!curl_setopt (\$ch, CURLOPT_FILE, \$fp)) возвращение FAIL: curl_setopt (CURLOPT_FILE); если (!curl_setopt (\$ch, CURLOPT_MAXREDIRS, \$redirects)) возвращение FAIL: curl_setopt (CURLOPT_MAXREDIRS); возвращение curl_exec (\$ch); - еще - curl_setopt (\$ch, CURLOPT_USERAGENT, 'Mozilla/5.0 (X11; U; Linux i686; ан-США; rv:1.8.1.11) Gecko/20071204 Ubuntu/7.10 (gutsy) Firefox/2.0.0.11'); curl_setopt (\$ch, CURLOPT_RETURNTRANSFER, 1); curl_setopt (\$ch, CURLOPT_REFERER, ; если (!curl_setopt (\$ch, CURLOPT_FOLLOWLOCATION, ложно)) возвращение FAIL: curl_setopt (CURLOPT_FOLLOWLOCATION); если (!curl_setopt (\$ch, CURLOPT_FILE, \$fp)) возвращение FAIL: curl_setopt (CURLOPT_FILE); если (!curl_setopt (\$ch, CURLOPT_HEADER, правда)) возвращение FAIL: если (!curl_setopt (\$ch, CURLOPT_RETURNTRANSFER, правда)) возвращение FAIL: curl_setopt (CURLOPT_RETURNTRANSFER); если (!curl_setopt (\$ch, CURLOPT_FORBID_REUSE, ложно)) возвращение FAIL: curl_setopt (CURLOPT_FORBID_REUSE); curl_setopt (\$ch, CURLOPT_USERAGENT, 'Mozilla/5.0 (X11; U; Linux i686; ан-США; rv:1.8.1.11) Gecko/20071204 Ubuntu/7.10 (gutsy) Firefox/2.0.0.11'); // если (!curl_setopt (\$ch, CURLOPT_FOLLOWLOCATION, правда)) возвращайте FAIL: curl_setopt (CURLOPT_FOLLOWLOCATION); если (!curl_setopt (\$ch, CURLOPT_FILE, \$fp)) возвращение FAIL: curl_setopt (CURLOPT_FILE); если (!curl_setopt (\$ch, CURLOPT_HEADER, 0)) возвращение FAIL: curl_setopt (CURLOPT_HEADER); если (!curl_exec (\$ch)) возвращение FAIL: curl_exec(); curl_close (\$ch); fclose (\$fp); возвращение SUCCESS: \$file (\$url); - возвращение FAIL: fopen(); - еще возврат FAIL: curl_init(); } } download file from link php. download image from link php. how to download video from php link. php link to download file from server. download pdf from link php
