Android: Ip webcam turns your Android Phone into a network camera, streaming your phone's camera through its Wi-Fi connection for remote viewing. Install the app, set up settings (enter/go, resolution, image quality) and then just download the URL it gives you in a web browser (I used Chrome for testing) or a client who accepts streaming video (I used VLC). Below is the setup I used to stream a view from my dwarf Cichlid tank to my desktop. I used two suckers and a black hair tie to protect the phone from glass. The same setup can be used to peer through the window on your parked car or from your front door. G/O Media can get commissionWhile individual stills are blurred, the overall video itself was fairly decent quality. While it won't replace a special hd webcam or security camera, it adds solid remote viewing capabilities to your Android phone and requires minimal customization. Ip webcam is free and requires Android OS 2.2. You can download it by searching for an IP webcam in the Android Marketplace or scanning the QR code on the right. For an alternative Android app check out previously reviewed zik. iPhone users want to check WebCamera for a similar phone on desktop streaming. Android Phones: Sick, the free mobile app new on the Android Market, promises live video streaming. Read moreIP webcam (Pro) Google Play via AddictiveTIPS Photo: Wikimedia Commons Ultimate Android 10 beta-Android 10 Beta 6 - now available for developers and enthusiasts to play. This build gives us an almost complete picture of what a public release for Android 10 will be like, which now includes some of the tricks Google is doing for its camera app. The biggest changes to Android 10 so far include new gesture controls and general user interface settings, but plenty of other core Android apps and features are also getting updates. Here are some of the key differences we noticed in the Google Camera app: Night Mode is now immediately available from the main menu, taking away a place previously covered by Panorama mode. The app will still display that annoying tablet notification that you turn on the night mode if the image is too dark, although it will now be much easier to use it in the first place. Screenshot: David MurphyBelt's balance and color temperature control have been completely removed from the app. Time to switch to more powerful apps if you need these controls. The front flash controls were simplified before the switch, and the feature was renamed Illumination, as it does not actually use the flash, but rather brightens the phone's screen to as a ersatz flash. G/O Media may get a commissionScreenshot: David MurphyIt is a safe bet that these changes will be carried over to a full release that is expected to begin sometime in the coming weeks. Owners of any Pixel phone can get early early on the new camera user interface and all other features of Android 10, choosing in the beta version of Android program. Home security is getting cheaper, smarter and easier every year. Thus, the market is shrinking for standalone home security applications. Most of the best are combined with a smart security camera these days. However, there are several options to explore for those who still have old phones laying around. Here are the best home security apps for Android! Those looking for home security cameras, you want to click here to check out our best list! AtHome CameraPrice: Free app/equipment worth moneyAtHome Camera is one of the best and more popular DIY home security apps. Its biggest feature is the support of several platforms. It has apps for Android, iOS, Mac and Windows. The service comes in two separate apps. The camera app turns the device into a camera, while another app lets you control. Some of the features include recording time lapse, multi-view up to four cameras, remote monitoring, and even facial recognition. It also has a number of hardware cameras if you want to go down this path. The app itself is free. Alfred Home Security CameraPrice: Free/\$3.99 per month/\$29.99 per yearAlfred Home Security Camera is one of the most popular home security apps for mobile devices. This allows you to reuse old smartphones for home security purposes. This one has remote access, live video streaming, some free cloud storage, walkie-talkie, zoom, and more. Many features are available for free. However, some things, like HD recording, are only available through a monthly subscription. It has its own problems, but the pros tend to outweigh the downsides for most. Otherwise the app is free to download and use. IP WebcamPrice: FreeIP webcam is one of the easiest home security applications. It turns your phone into a remote camera. The app has a decent if basic feature set. These include VLC player support, live video streaming, iVideon support, FTP and Dropbox server support, motion detection and video chat support. This is one of the few good free home security apps. It will take a few minutes and some brain power to adjust, however. The app is supported by advertising. Otherwise, it's completely free. TrackViewPrice: Free/Up to \$59.99 a year TrackView is a kind of all-in-one option for this kind of thing. The app contains a two-way radio, a family function GPS is a telephone histor, and it functions just like a home security camera. Security camera features include motion detection, night vision mode, remote audio and video recording, and cloud storage for backup recordings. This one has several tiered plans that unlock different things. It can get quite expensive, but cheaper versions should work well enough for most people. WardenCamPrice: Free /\$5.99WardenCam is another home security app your old phones. It claims to work anywhere over 3G, 4G and WiFi. In addition, the app offers multi-camera installations, support for Google Drive and Dropbox, motion detection and alert, 2D audio support and above-average developer support. This requires one cost, not a monthly subscription. It's always preferable. The user interface is decent and the app is pretty easy to use. Bonus: Actual Smart Security CameraPrice: Free Apps/Equipment Prices VaryThe best home security apps paired with their hardware counterparts. Popular smart home products such as Nest, Netgear and LG smart cameras have their own apps. In addition, some traditional security companies, such as ADT or Vivint, have begun rolling out their own applications. Finally, there are a number of security cameras available from companies like Nest, and most of them have apps as well. Generally speaking, it's best to find a hardware camera that works best for you and just use the app that it comes with. Good luck! If we missed any great home security apps, tell us about them in the comments! You can also click here to check out our latest Android app and game lists! The world of smartphone cameras is complex, not that people rely on points and shoots less and less, while placing more demand on their phones. There was a rough transition period between the two product categories, but the AI arms race did figure out which cameras were worth your time. Part of the problem is that objective results only tell you so much - if Instagram has proven anything at all, it's that perfect isn't always what looks best. PhilosophyConsexconformally, we primarily focus on subjective results, as past data regarding objective performance have proven to be a poor predictor of subjective image quality. Some measures are more useful than others, but as people are our target audience: it allows us to take a more direct approach to the average consumer. While we fully recognize that our constellation of tests does not reflect every possible situation out there, we believe that our estimates will adequately reflect the quality of each camera - especially considering how much goes into each test. Where there are multiple cameras on the phone, we record the best results from the most capable modules. Subjective testingIn the current we have created every phone and ready, we take the phones to the city to see how they perform in the standard set Nothing like using a camera in the real world to highlight the flaws, right? While you may not be thrilled with every shot, keep in mind we are emphasizing the limits of the camera that by all accounts should not work at all because of the physics situation. The emergence of AI cameras and computational photography in the transmissions of our testing, both cameras tend to behave differently when these features are included. In addition, these features also aim to eliminate the need for post-processing, applying machine learning to what makes the photo more pleasing to the eyes. We are working on a more standardized test for this, but for now we have to make comparisons. Wherever we can, we will provide a comparison of sliders of the same shot scene on two cameras, so that you can see it for yourself. Shotlist For each phone we review, we take several photos in a narrow set of situations in which a typical smartphone user may want to take a picture. For example, in a dimly lit restaurant, bright landscape during the day, selfies, etc. Below are the scores that we record and cool for our use: ColorDetailLandscapeHDRPortrait modeSelfieVideoLowlightDaylightroom / telephotoWide-angleApp functionalityKeep in mind, one shot is not enough for any of these categories, and they are not repeated by category. Thus, human error is minimized as best as one might hope when taking many, many photos. Note about varianceln all will agree with how we do things in this test. Ok. That's why we publish our results. So everyone can look and see what's important to them and make their own decisions. Keep in mind that this testing primarily identifies flaws that can be mitigated with image editing. We don't edit our photos in our tests, so you may be able to improve their aesthetics with your own experiments. In addition, you may find that you like technically imperfect things such as color oversaturation, oversharping, beauty modes, or aggressive noise reduction. While this is an objectively poor performance, more and more people are asking more and more things from their smartphone cameras that will shock a professional photographer. Because we don't write our reviews for a professional shutterbug, we instead try to test for width instead of depth when it comes to camera performance. Performance.
