## Pokemon diamond guide

If you're a Pokemon Go player, you're no doubt paying sharp attention to the CP number associated with every Pokemon you catch. While combat in this game is still evolving, brute force has emerged as a more important aspect of engagement than type differences. Speed is important as well, but CP ratings are a pretty honest indicator of what Pokemon will come to the top of the engagement. But which Pokemon is currently the most powerful? See also: For lower and medium-range players, cp removal is not such an important problem. You can catch a naturally high CP Pokemon if you're a pretty high-profile player – think 20-30 range – so this topic is really more important for players who want to bulk up their dream team late in the game. Each Pokemon species has Max CP, which means that even the most powerful wild Pokemon caught by a high-level player does not exceed that figure. Pokemon with the highest Max CP, of course, Mewtwo, who watches is 4145. According to GamePress, most of the very highest ranked Pokemon are not even available in the game yet. Dragonite sits pretty in second place with 3,500, while the next three lineups are Mew, Moltres, and Zapdos. That right: Moltres are the most powerful legendary Birds. Articuno watches all the way at 9 ranking positions under Snorlax, Arcanine, and Lapras. But hey, I guess Niantic had to throw Team Valor's bone because their player base consists only of reprobates and ne'er-dowells. Check out GamePress's sortable list to see where your favorite Pokemon falls on a CP scale. You magikarp fans out there, sorry, but your splashy little friend rides at the very bottom, and even if you churn out 400 karts to get gyarados, the mighty sea monster unfortunately doesn't even crack ten. Pokemon Go was a really interesting method of tracking Pokemon when it first came out. You had a map nearby that showed three feet. As you get closer to Pokemon, the foot could disappear until it just appeared on your map. Eventually, a sighted tab was introduced, although it was later removed. Today, the nearby feature has been reworked. This is now the only official way to track Pokemon Pokemon Go. That said, there are several other ways to track Pokemon if you're willing to put in a little extra work. Here's a short tutorial on how to find Pokemon Pokemon Go. Track Pokemon using NearbyMixed nearby tracker is currently the only way to find the Pokemon app. It's very easy to use: On a nearby screen, you'll list Pokemon as well as a list of Pokestops. It gets really easy from there. Just travel to this Pokestop and Pokemon that you are looking for would be nearby. You can tap Pokestop near the screen to see what Pokestop it is. Those who are not sure what Pokestop is what can tap again and the card will temporarily zoom out and show you what Pokestop you need to travel to. Check out the video above for a quick 15 second view on how this feature works. This is a little more accurate. You know that Pokemon is sure somewhere around that Pokestop. It's a little less tedious than the previously available Sightings method, but you may still have to walk around and find it. Track Pokemon using third-party trackerst is both the most correct way to track Pokemon and also the most difficult. When you find one of these tools, they're actually very simple to use. You just open the tool and Pokemon appears on the map. However, Niantic frequently updates its API to shut these sites down. Enjoy them until they last, but expect to get a good find for more. Here's how these works: Find a Pokemon mapping service. Google is a user-generated one that you can find by clicking here. It won't show you where Pokemon is, but it will show you where some of the uncommon varieties tend to spawn so you can hang out in the area. Third-party trackers set the source user data. It will show you where Pokemon is exactly, but it's not always accurate. For example, as it works, check out Pokemap. They don't get shut down so often, but they're also not as reliable. There are valuable some trackers that use Niantic's API to show you where actually Pokemon is spawning in the game. The most popular of these is FastPokeMap. It goes up and down quite often thanks to changes, niantic makes it to the API. However, when it's up, it works flawlessly. These three methods are about just ways around right now that you can track Pokemon. However, there really isn't much more that you need. You still have a nearby tab, even if all third-party trackers go down for better or worse. There are additional ways to track and catch Pokemon, but they require pretense that is against the rules and perhaps you are banned after all. If you have any additional tips or tricks on how to find Pokemon, tell us about it in the comments! Click here to see the latest Pokemon Go news! Read more: How to hatch eggs in Pokemon Go If you've ever looked at a sparkling rock on your toe and wondered if it was truly real or very convincing fake, don't feel guilty. Jewelers are regularly asked if the diamond is real or not, and it is certainly not a superficial question. Maybe you're worried about the legitimacy of the jeweler it was purchased from, or maybe you just want to be absolutely sure that what you're wearing is the real deal. A careful look at your stone probably won't give you any answers here. Anyone who is not familiar with diamond structures and components will find it easy to mix a real diamond with a synthetic stone, such as one made of cubic zirconia or moissanite. synthetic is so real looking that you can go months or years without realizing it's a fake! If it sends your blood pressure skyrocketing, don't worry, there are plenty of at-home tests you can do to uncover the truth. [These tests] really depend on what the stone is made of, said Nicole Wegman, founder and CEO of Ring Concierge. Not everything is cubic zirconium; There are different synthetics and different ways to make a false diamond. You really should do a variety of these tests before you jump to the conclusion that the stone is real. It could pass one test, but then not the other. Meet Expert Nicole Wegman is the founder and CEO of Ring Concierge. Ready to pass your diamond test? Read on to learn how to tell the difference between real and fake. 01 of 08 One of the most aesthetically pleasing things about diamonds is the way it sparkles and shimmers in sunlight. Put your stone through this test by looking at the colors it reflects. You should see both rainbow shades and white winking back at you, not just white. If there is no reflection of color, if it is just a reflection of the white back at you no matter how you play with it and turn it around, it won't be real, said Wegman. Diamonds certainly reflect a combination of white light and rainbow. 02 of 08 Here is where things get a little confusing: One sign of CZ may be the lack of color, but there are still too many colors. If it's CZ, it's going to be very, very, very rainbow-y and really bright, explains Wegman. It just almost looks too good to be true because it's too brilliant. Of course, a real diamond will be brilliant, but as Wegman points out, it is also going to be more subtle than CZ. Basically, if you think a diamond is too good to be true, it's very well could be. Wegman notes that this test works better with a side comparison than looking at the stones separately. 03 of 08 A quick and easy home test is simply to breathe on a stone issue. If it's a real diamond, it's less likely to fog up because the condensate doesn't stick to the diamond in the same way it's going to stick to synthetic, said Wegman. However, if you breathe on CZ, you will notice that it stays fogged up much longer. It is worth pointing out that this is another test that works better if you compare rather than looking at stones individually. 04 of 08 Remember, diamonds are pretty tough to break, which means that nothing can scratch them (aside from another diamond). So if you can work up a nerve, grab a knife and gently scratch the top of the stone. If it scratches, it's not a diamond, it's definitely synthetic, said Wegman. The idea of trying to scratch it is probably not going to be the easiest thing in the stomach, but a true diamond will not scratch out of stainless steel, cz should scratch immediately. 05 of 08 Doing a quick hot/cold test will make your heart race, but it can also show you the nature of the stone. Start by holding the stone over the flame (yes, real), and then drop it into a glass of ice water. The idea is that real diamonds will not shatter, but false diamonds will be due to extreme temperatures. You can put as much heat as you can imagine until the diamond is damaged, Wegman continues. A false can't handle the heat like that. Although you can destroy your fake in the process, a real diamond will be intact. 06 out of 08 A less risky option is a float test. Drop the stone in a glass of water. If it sinks, it's probably real, but if it floats, even just a little bit, it's a fake. The only problem with this one is that it's not always 100 percent accurate. A real diamond is definitely a sink, but it probably depends on what synthetic is made of, Wegman explains. While CZ could float, counterfeits may be made of other materials, and some of them may be heavy enough to sink as well. Moral Story: If it floats, it's a fake. Where does it sink? Could go any way. 07 of 08 According to Wegman, the most accurate DIY test is the at-home diamond selector tool that is sold on Amazon. This is a fairly small handheld device that you just turn on and touch the stone. It will tell you immediately if it's a diamond, said Wegman. She suggested reading the reviews to make sure it's legit, but otherwise said it's a safe bet to trust. 08 of 08 Although these home tests are quick and easy to perform, they are not simple. There are no super-easy tricks, said Wegman. At the end of the day, if you're not sure, your best bet is to catch a stone jeweler because they'll be able to tell almost immediately. Jewelers have tools and high powered magnifying glass to get the job done, as well as experience and education to help that up, and visiting one will clear things quickly. Quickly.
