## Atec pitching machine speed chart

Trusted by many nationally ranked college programs to develop elite players, the ATEC M2 Softball Offensive Machine can drop collegious-level pitches at any site in the strike zone. The Quick Change Tilt System allows you to easily move the angle of the head of the machine to change the rotation axis of the tossed ball. The machines account for 70% of consistent and accurate ball flying and the balls account for the remaining 30%. ATEC bye. The Per(R) ball line is designed with proprierty aerodynamic design that maximizes the accuracy of the training machine to achieve the most adequit ball flight each time. Note The Pitching Machine speedIf the maximum speed is 70mph is quoted for that machine, at what distance is it at 70 mph? Distance has nothing to do with speed. When we say that a machine has a maximum speed of 70 mph, this is the speed at which the ball comes out of the machine. When people talk about speed at different distances, it's important to understand that the machine doesn't actually travel at a different speed if it's closer or farther to it. They suggest comparing the time the ball travels different distances at a certain speed. For example, if you set the machine to a track of 70 mph and set it 10 meters from your home plate, the track will have a home plate in half the time (or twice as fast as) it would take the same track to go 60 meters. Therefore, it can be said that it seems like 140 mph at 30 feet, but in reality, the ball still travels at 70 mph. When calculating the comparative speed between 60 feet (High School and above) and 46 feet (Little League distance), you can really compare the time it takes for the ball to go 46 feet instead of 60 feet. To compare the time of the ball travel of any two distances, divide the longer distance by the shorter distance and multiply the result by mph. For example, 60' divided by 46' is 1.30. Multiply by 1.30 times 70 mph and you have 91. That's why we say 70 km/h from 46 feet to 91 km/h from 60 feet. But remember, the track doesn't actually travel at 91 mph. It just seems like 91 because it can whipped you up from a shorter distance, so the ball starts at home plate sooner. Another way to look at it is to speed the ball relative to the distance from the pitching machine to the batter, and the effective speed of the dough experience is more a kin of reaction time. Players take their time in the cage serious, why only allow the places thrown at them to hittable? Baseball players are better at repeating in cages, ripping pitches after pitch, day after day at practice. Atec pitching machines make batting practice more effective, which is better for players and coaches, especially the BP coach avoiding Tommy John surgery. Atec (Athletic Training Equipment Company) is based out of Sparks, Nevada, and makes pitching machines and accessories that take the team's practice to the next level. The company is part of Amer Sports, which also owns Wilson, Demarini, and Louisville Slugger-branded baseball equipment. The types of Atec Pitching MachinesAtec pitching machines are designed to train professionals. A high-quality, durable product, comes at a cost. When you first look at the price range of the array of pitching machines, you will see dollar signs in large quantities. Compared to other pro-level pitchers, the cost is quite similar and, in some cases, cheaper. Consider the following four models of devices. M3 Baseball pitching machine | MLB Level Pitching MachineThe M3 pitching machine is the pinnacle of the line offered by Atec, built to train professional players. The M3 has a 3-wheel design that allows hitters ready to crush the ball, with full visibility of the ball on the field cycle. There are no surprises coming out of this machine so players can improve their timing and focus on pitch recognition. The 3-wheel design also enhances the overall surface contact of baseball, which helps with superb pitch speed, accuracy, and ball spin per pitch type. The M3 is equipped to throw the ball up to 105mph, allowing it to train against high league speeds and determine if it can hang out. This model of pitching machine also pitches curveballs, sliders, splitters and cocks. There is a really nice guide on the side of the ball feeder that shows you the settings needed to change the pitch type. The M3 is compatible with skin, dimple and foam balls depending on what your training situation asks for or the location needs. It comes with a 5-year warranty and is designated as the official machine for Major League Baseball.M2 Baseball Pitching Machine | Collegiate Level Pitching MachineAtec's M2 baseball pitching machine is trained to train those players at the collegiate level. Unlike the M3 professional model, the M2 is a two-wheeled machine, but still able to hold on to its own. The M2 also cranks it up to 90mph and delivers collegiating level fastballs, curveballs, and sliders to every spot you desire. Atec is proud to state that the M2 baseball pitching machine is used and trusted by many nationally ranked college baseball programs to train elite players, developing hitting skills to the next level of talent. Speed of M2 pitch at 30mph-90mph, a little less than the M3 while losing some track choices. The device level includes a quick change tilt system to simulate the change of throwing hands and shooting the whipped balls. Once again, this device is compatible with skin, dimple, and foam balls, depending on your location and need. M1 Baseball pitching machine | Travel League Pitching Machine up to 15 yearsThe Atec M1 baseball pitching machine has the lowest level pitching simulation tool Atec has to offer. Although the lowest, the M1 is rated the most powerful and long-time in the single-wheeled casting machine category. It uses many of the same parts as higher level devices, including concave rotating wheels. The wheel is designed to increase the adhesion of baseball, which in turn, like other devices' status, maximizes both the speed and accuracy of the pitches thrown. Due to the portable nature of the device, it is better suited for work on the field and in the batting cage. The M1 can throw fastballs as well as right or left handed curveballs. Like other devices, the minimum pitch speed is 30mph, but the maximum you get out of the M1 is 70mph. This model seems to be good for typical batting cages and travel baseball for up to 15 years. Once you hit 16+ years ago, the speed may not be suitable for a realistic batting exercise session for those playing baseball at a high level. You can change the distance from which the field balls simulate higher speeds. The response time is the lower the machine, so you can feel the speed of the Major League with a little finagling. Atec M1 series also adopts leather baseball, dimple, and foam ball hitting action. R3 and R2 Baseball training machines | Infield-Outfield Batting Tool Although this article focuses on Atec pitching machines, I couldn't help but include the R3 and R2 baseball training machines in the review. Both models of Atec are designed to work with players' defensive skills. The tools throw balls with the ability to simulate grounders, line drives, fly balls, or pop flies with great recovery time to launch the next ball, thus increasing the effectiveness of defensive practice. Let's face it, everyone likes hitting cage bombs off the plane, but for good/solid protection if you're a pitcher's best friend. In R3 or R2, there is a consistency of hits and give coaches the opportunity to field their players, instruct and not hit fungos 70-90 feet away. These tools are obviously geared towards professional and college-level programs, but still, a great addition to the Atec line of machines and phenomenal opportunity to increase efficiency in practice. Pitching Machine BallsAs with any device, the manufacturer can recommend what accessories to use best to comply with the listed specifications. Atec has three rows of throwing machine balls that are designed to be used in the series of pitching machines. The Hi.Per Pro leather flat seam baseball is designed to maximize the efficiency of any Atec pitching machine. The balls have high quality skin like any other baseball, but seams are made of low-profile high tensile Kevlar. This project will increase their lifetime of usage and create an increased accurate launch to ensure your clubs are maximizing their time in cages. Atec's Hi.Per X-Axt Dimple baseball is designed as the typical batting cage balls can be seen in many batting cages. These balls, however, are designed with a patented anti-sting material that allows players to work through the wrong hits in the cage and not with their hands constantly feeling the sting. Another key to these dimple balls is that they are safe for all power bats and regulation the weight and size of a baseball. There's nothing worse than coming home from a batting cage with a dented baseball bat. Buy an Atec Pitching MachineAtec with line pitching tools delivered by many major retailers across the United States. You can take them directly to atec website, but you'll find a slightly better price if you hunt around with some resellers. If you keep watching on eBay, there will be machines that are used and definitely available for a big price cut. Many parts can be replaced on the Atec device, so you might be in a partially functioning device doing business and ordering parts for repair directly from Atec's premises.
