Playlists and other information about the media are stored in this database file: /data/data/org.videolan.vlc/app_db/vlc_media.db The easiest way so far is to change playlists from within the application by adding/deleting media files from/to them. However, if you have root access to your phone/tablet, sqlite editor/reader (you can get one here), basic knowledge about SQL and a little patience you can change playlists by doing the following: Go to /data/data/org.videolan.vlc/app_db and copy vlc_media.db into the folder you have full resolution. Open the copied file mentioned above using the SQL editor app. In the Tables tab, you'll see all the tables, including Playlist, Media, PlaylistMediaRelation, AudioTrack and VideoTrack. In the SQL Editor tab, insert the code below to get a list of all the playlists and their files, then click on the Run button: SELECT id_playlist, name, file_name FROM playlist Internal Join playlistmediarelation ON playlist_id id_playlist Inside join the media on id_media media_id WHERE the name and your_playlist_name ORDER by id_playlist To check your media files with their IDs: SELECT id_media File Name from Media From this information, you can change your playlist (s): To insert / media app into the playlist: INSERT INTO PlaylistMediaRelation (media_id,playlist_id) VALUES (520,1) To remove multiple media files: DELETE FROM PlaylistMediaRelation WHERE media_id IN (456, 520) and playlist_id No. 2 To update the media : UPDATE PlaylistMediaRelation SET media_id=321 WHERE media_id=476 and playlist_id No. 7 Be sure to copy the file back to the original folder. Note: The ID numbers in the code are just examples. Pen Video Playlists Some questions : Audio : No metadata displayed before playing How to save/create video playlists How to show video playlists Video playlist order, reordered, other questions When adding video files to the playlist, videos must be added 1 by 1 to get the desired order. It is not possible to reorder the video. Videos added to a playlist should always be at the end of the list; however, when the video is removed from the playlist, it is re-added, it moves back to the position that was before the deletion, not at the end of the playlist, as it should be. Possibility ordering multiple videos according to the chosen order when creating a playlist will be a great opportunity to drag and fall like a queue to rearrange the playlist and save changes Adding the same video twice possible and should be, but if you add by mistake, then deleting one removes both, which forces you to add it again. Here are some hidden VLC features on Android. The video on your Chromecast VLC doesn't support Chromecast yet, but you can already use it! Android can throw its screen content and audio to it. Here are some ways to access this option: VLC detects a secondary display (your Chromecast) as it happens if you connect the device to the TV with hdmi cable, and the video player will show you this You have normal controls like swipes to look for and go to advanced options while watching a movie on TV 📺 🛑 STOP playback service there are 2 ways to completely stop the VLC player service (and not just pause playback), but this action has no explicit button. With a mini player: press the play/pause button with the play icon: only when you pause play on Android 5: you can hold a notification. on Android 4.x: You must have the 'x' button in the top right corner. Repeat Video With

Version 2.1 you'll have a repeat button available in the video player advanced options, but you can already do so with version 2.0.x: Long click on the play button/pause to switch playback to snooze mode, so video playback will loop Just drag the smes in the current playlist to reorder it. Download the latest In Bar Action playlist, the circled play button starts downloading the last playlist from the current category: in the video view it will download the latest video (s) played, in the audio view it will download the last audio playlist. With a remote control play/pause (wired headset or Bluetooth ad2p), when VLC isn't playing, you can download the latest audio playlist and continue playing where you stopped it. The next/previous swipe miniplayer on the left/right triggers move on to the previous/next media. Video player snaps If you have a keyboard or gamepad connected to an Android device, Here are the key snaps in the video player: in the DVD menu: Key (s) Action No. ← → navigate Gamepad A or X/play/pause/space/OK/enter click on the focused item in video playback 360 (version 2.1.0): Key (Key) s) Action No. ← → change the point of view of a normal case: Key (s) Action F/fast_forward/ ← search (10 seconds) R/rewind / ← look (-10 seconds) R1 look (1 minute) L1 search (-1 minute) A (gamepad)/play/pause/space/OK-switch play/pause-O/Y (gamepad)/menu/show extended V/audio track/X (gamepad) open subtitles N show DVD video menu M/Mute Switch Sound Dumb S/STOP Stop Play and Exit Player Subtitles select subtitles J delayed audio (-50ms) K delayed audio (50ms) G delayed subtitles (-50ms) H delayed subtitles (50ms) tags : Android, vlc Category: Features Updated: February 22, 2017 This post is not about books, but can be useful to many, and perhaps especially for those who downloaded audiobooks. The problem: While the free VLC Media Player is excellent, one of its enduring mysteries is what happens when you drag and drop 1, 2, 3, 4, etc. list of files into a new playlist. Ordering a playlist too often is made into 4, 1, Even in the new version of 3.0 VLC, there is still no way to then re-sort the distorted playliist by the name of the file. You can re sort in several ways, but not by the name of the file... It's annoying if you have a list of tracks that need to be played in order, such as a carefully curated 50-track trance music set, hundreds of short audiobook recording clips, or or Presentation consists of a large number of small video files in a carefully measured sequence. For various good reasons you want to use mature and stable and ad-free VLC for them, but you don't want to spend 20 minutes tinkering with manually retelling a playlist by the name of the file. And you can't just use the ubiquitous Windows Media Player to make a properly ordered playlist and then save it and take the list to VLC. Why? Because while VLC claims to understand its own Windows . WPL and. M3U, in practice it is not. Download a. The M3U and VLC's playback attempts go awry in the endless download cycle. Download a. WPL playlist and you only get the first track on the list. Download. The ASX's VLC and list are intact, but some of the files in the album will be grey and unrepeatabl. There is no way to keep in native VLC. The XSPF format is from Windows Media Player, and there is no plug-in to turn this on. Solution: Here's how to quickly get the proper 1, 2, 3, 4 file-name order playlist to VLC: 1. Get free Windows free open source Amarok player software, install. (It can be a very slow download and you can shop around for faster mirror servers. it also takes an age to install and then load), Amarok can come out. The XSPF playlist format required by VLC. 2. Install and download Amarok and then download the correctly ordered playlist in this way... Top Menu: Add Multimedia Playlist. As you can see Amarock has no problem with then offers a full range of re-sorting options for your playlist... Once you're happy with the order, click the floppy disk icon under the list, and this will keep the playlist in the Amarock database (which ended on the opposite side of the screen). Click the right button on this saved playlist name and Export as To whom. XSPF format. The playlist must be saved and played along with. MP3 audio files in the same folder and not then moved elsewhere. This is due to how the file paths are written inside. XSPF playlist format. 3. Now you can download. XSPF playlist in VLC and it will keep properly sorted playlist order. In the VLC playlist window, I can't drag items to change their order. It is ok? In every other media player I've used before, it's possible. At this point I'm resorting to clicking on the title to sort the list in order, which is what I want, but I can't guarantee that I'll always have the title so correct! UPDATE Nobody? I would though this would be a major feature... One of my favorite software applications to date is VLC Media Player. I like the way he plays whatever you throw at him, and I especially its playlist features too. If you are in a stream, work-wise, there is nothing worse than having to stop all the time to start a new MP3 album or one new song. It's much nicer to be able to pre-load multiple albums into VLC Player all at the same time and and he's doing his job. Today we'll see how to customize and manage these playlists. Opening VLC Player When you open VLC Player for the first time, you'll see an empty playlist like this. If you don't, go to a review and either select a playlist or a match playlist. Now you have to see the playlist view. As written off in the main window, the first option is to drag a media file or folder into the window. It will take media files and download them in a consistent manner. Yes, I like the Backstreet Boys. Don't judge me. Alternatively, you can look at the options left to find the media to play with. Either the media on your computer or online media such as podcasts and radio. There's actually a third way to download tracks (but only in Windows). When you install VLC Player, you'll get two new options in the right click menu, as you can see below. Choose one and the tracks you're highlighted automatically get added to the VLC playlist. The difference between the two is that Add to the VLC playlist the media player will add tracks at the end of the playlist and will play when the previous tracks are finished. Play with the VLC media player, on the other hand, overwrites the rest of the playlist and plays highlighted tracks immediately. Saving playlists Sometimes you want to keep playlists if you have a sweet setup going on and you don't want to keep remodeling the same playlists over and over again. To save the current playlist, just go to the media-zgt;Save playlist for the file. By default, VLC Player will try to keep playlists in XSPF format. But I would suggest going instead with the M3U format instead. Once you've given a name to your M3U playlist and saved it on your computer, double tap the playlist and it will automatically upload to the VLC player and start playing. But saved playlists also record the location of these media files on your computer, as they are basically text files with the location of each media file. So you can't move the location of these files on your computer, or expect a saved playlist to work on another computer. Otherwise, you'll get error messages. If you have to move the music to another location, you will need to make a new saved playlist again, which points to a new folder. Shuffling and looping Once you have playlists all set up, there's nothing to stop you from shaking things up a bit and introducing some randomness into your life. First, the last three controls at the bottom of the media player are linked to playlists. Left to right: First, to switch the playlist and turn it off. Second, the playlist cycle, so when it's finished, it starts again. Third for VLC Player randomly the next song from the playlist. If you click on the song, the context menu will also give you sorting options. The output of playlists is actually quite overlooked feature in many many Players. People are happy to download one song or one album at a time when there is absolutely no need to do it piecemeal like this. A what.
