In fact, you can download and upload files to the mul even without using the many talked about servers. As? Take advantage of the Kad, a network that allows you to share files with eMule convert each computer into a type of server in its own right. In it, you will be able to locance almost all files on the eD2K network (those of the servers) and load it at fairly fast speeds without the fear of running spies ready to monitor your online activities. The only problem is that during the first uses it can be a little difficult to configure, nothing dramatic anyway. Read the guide on how to connect to the eMule Cad network you find below and I assure you that you will be able to download files at excellent speeds without having too many expectations and without dealing with complicated configurations. The procedure can also be implemented on Mac, if you use aMule. Now, however, let's not get lost further in chatter and move immediately to action. Scroll up your sleeves and start configusting your eMule (or aMule) as below screenshot shown. How to use the Kad network on eMule Let's start by saying that there are two ways to connect to the eMule Cad network: one that completely excludes the use of eD2K servers – which is what I recommend – and another that rather uses servers as a bridge to find nodes (these are the computers of the other users) needed to establish a functioning connection. To connect to Kad without using eD2K servers, you must on a configuration file called node.that contains all the coordinates that allow eMule to find nodes to establish communication with the network. Establish. are several websites from which you can download this file (for example Nodes.dat or Emule Mods) but unfortunately, given the decline in popularity suffered by eMule over the past few years, those who work are less and less. If those I'm about to point out to you need to stop working, try searching new ones on Google. Now let's move on to action. The first step you need to do is to go to the eMule Cad tab and paste the tick mark next to the Load nodes.that item of the URL, then you need to paste one of the addresses you find below in the text field next to the item you just marked, and click the Bootstrap button located at the bottom right. Within a few minutes, your eMule must connect to the Cad network: you'll see the arrow that gets yellow in the app status bar (bottom right) first and then green. if they had to spend a few minutes with the yellow colored arrow to download a file with very active sources (eg. A Linux distro and the situation must go down. If you want to use the Cad network with the eD2K network, normally connect to a server by selecting it from the eMule tab, then start downloading certain files with a good number of resources and waiting a few minutes. When you've reached a good position in the download string (so you download at acceptable speed), go to the eMule Cad tab, put a check mark next to the Item of famous customers and click the Bootstrap button. Within a few minutes you should be able to use both networks profitable. Now you can set up eMule to search for files on the Cad network or on the eD2K network. Then click the Search tab of the program, expand the Search Method drop-down list and select the item Kad Rete or Global (Server) from the latter, depending on whether you want to do a search on the Cad network or on the eD2K network. At this stage, start a new search that normally uses the bar under the heading Name and download your favorite files. With the Kad network, searches are a little longer to complete than servers, so if you don't see many results appearing immediately, don't worry. The search is completed only when the bar is located at the bottom of the window, reaches the end (from left reaches it right). It was easy, wasn't it? From now on, connecting to the Cad network is all you have to do is open eMule, and click the Connect button at the top left (to connect to the Cad and eD2K networks simultaneously) or on the Connect button located on the Cads tab (to connect only to the Cad network). In a nutshell, you will no longer need to use the Bootstrap function and thus will no longer have to endure long wait to establish the connection. How to use the Kad network on aMule for Mac, you have a aMule instead of eMule? No problem. The procedure you must follow to connect to the Kad network is almost identical to the one we have just seen together for eMule on Windows. Then start aMule, click the Networks button at the top left and select the Cad tab from the screen that opens. Paste into the Text field Nodi one of the below addresses, press the Enter key on your Mac keyboard, and click the Yes button to establish the connection to the Cad network. Alternatively, if you prefer to connect to the Cad network via the customers identified on the eD2K network, go to the Networks &t; Cad tab of aMule and click the Bootstrap button of well-known customers located on the right. If the connection to the Cad network isn't working... Can't you connect to Kad? The arrow in the bottom right doesn't turn green? There may be a problem with your router configuration. Probably the device blocks the ports, i.e. the communication channels, used by the program to connect to the eD2K and Cad networks. To make sure this is the problem, click the eMule Options button (at the top right), select the Connection item in the window that opens, and click the Test ports button to start a door check. If, as can be largely guessed, the TCP and UDP ports of your eMule are blocked, please set up the router correctly following the instructions you find below. Open the browser you usually use to browse the Internet (e.g. Chrome or Internet Explorer) and connect to the address 192.168.1.1 or address 192.168.0.1 to access the configuration panel of your router. If not working address, find out how to enter the router in my subject directory; Log on to the router management panel using the combination admin/admin or admin/password. If none of the two combinations of username and password works, try to solve the problem by in practice the instructions you find in my tutorial on how to see the modem password; Access to the Port Mapping or Port Forwarding section of your router's admin panel (unfortunately, I can no longer give you accurate information, as each trademark of modem/router has structured a management panel in a different way) and click on the item to add a new rule or create a new virtual server; Fill in the form suggested to you by ensuring the number of TCP port used by eMule as internal door and external, select the item TCP from the drop-down menu associated with the type of port to be configured and enter the IP address of your computer into the IP field destination or In. If a rule name selects the one you want (e.g. eMule TCP); Repeat the same operation for the eMule UDP port by ensuring the UDP port number used by the program and the UDP value as the internal port and external port and save the changes to start eMule Kad network without connection problems. . If you don't know what your computer's IP address is (let's talk about local IP address), follow the directions you find in my guide on how to find IP. To find eMule's TCP and UDP ports, go to the Program Options instead, and select the Connection Item from the left sidebar (in the window that opens). The procedure to follow is the same, even if you use aMule on Mac. For more details, see my tutorials on how to open eMule ports on Windows and how to set up eMule on Mac. Mac.
