See: If I change it that way: (same for 'sudo su', 'sudo su', 'sudo-s') I can log in, but no copy, write wont executed anymore. So ask a simple: how do I edit files on WinSCP? Last modified by logo78; 2015-09-27 at 05:01. 2015-09-27, 13:44 #3582 Originally posted by logo78 Hi, if I want to use WinSCP as a graphics file manager, I have problems logging in as root, respectively, automatically change the user root after logging in. See: If I change it that way: (same for 'sudo su', 'sudo su', 'sudo-s') I can log in, but no copy, write wont executed anymore. So ask a simple: how do I edit files on WinSCP? Normally log in is the user: tc Password: piCore Try it (at your own risk) If you want to change the user's root, then I think you need to use Putty and SSH to pi and type sudo passwd (press Enter) Enter the password (no words are displayed, press Enter) Repeat password (press Enter) Then in WinScp you can log in as root. 2015-09-27, 14:28 #3583 Originally posted by the man in the delivery Normal login is the user: tc Password: piCore Try it (at your own risk) If you want to change the user to root, then I think you need to use Putty and SSH to pi and type sudo passwd (press Enter) Enter password (no words are displayed, press Enter) Repeat password (press Enter) Then in WinScp you can log in as root. Thank you for your feedback. With this hint, I can log in as root with WinSCP and list directories, but when I try to read/write/edit a file, I get the following error Probably missing dropbear settings? Last modified by logo78; 2015-09-27 at 14:30. 2015-09-27, 15:00 #3584 Originally Published logo78 logo78 If I want to use WinSCP as a graft file manager, I have problems logging in as root, respectively, automatically change the root user after logging in. So ask a simple: how do I edit files on WinSCP? Hi logo78, By default piCore does not have root login. Try adding superuser bootcode to cmdline.txt. I've never tried this since I'm old school about using root login, so I don't recommend it as good practice. We develop piCorePlayer using WinSCP, logging in as tc. If access is needed, I go through ssh. This is our process. Do WinSCP New session to piCorePlayer as tc. The right pane will be piCorePlayer, the left pane of Windows 7 PC. (Synchronize browsing when views are aligned) Double-click the file in the right pane (pCP), the file opens in Notepad++ on the PC. In the edits, click [Save]. Saves the file to pCP. If you're happy with your edits, sync locally. This copy changes the files from pCP to PC. The directory on the PC is also git checkout directory. Stage and confirm files using git. Remember: pCP is in ram, you need to make a backup to pCP to save files to the SD card. But if you forget, you can sync back from PC to pCP using WinSCP, or even get the file back from git. PiCore guys use mc, a text based program as a local file manager. goes Greg 2015-09-27, 15:02 #3585 Originally Published logo78 Thank you for the feedback. Using (v) the famous Edimax dongle blighter will not be wireless IP address. Any ideas? Your mob are doing well here, I look forward to the Welsh game (Oz kicker could have had more practice by then) Ronnie Last edited By The Man in the Van; 2015-09-27 at 3:20 p.m. Reason: keyboard stutter 2015-09-27, 17:23 #3588 Originally posted by the man in the delivery Hi Greg, I just finished doing #3588 new installation v21b on the old rpi B running HifiBerry Digi. Using (v) the famous Edimax dongle blighter will not emit a wireless IP. Any ideas? Ach no! What does wifi [Diagnostics] suggest? Bad SSID or password? BTW: There is a message in /tmp after running [Diagnostics]. Your crowd are doing well here, I look forward to the Welsh game (Oz kicker could have more practice by then) until we get to Japan! goes Greg 2015-09-28, 07:04 #3589 Originally added Greg Erskine Oh No! What does wifi [Diagnostics] suggest? Bad SSID or password? BTW: There is a message in /tmp after running [Diagnostics]. Until we get to Japan! as for Greg Greg, I couldn't find the [diagnostic] card, so decided today to format the card and burn a new image. The only thing I did differently was connect the dongle as I booted up for the first time, I look at the wireless sequence load and it all seemed familiar, but this time I get a wireless IP. Turned off the player and disconnected the rpi and rebooted, everything came ok, but the boot seems to be almighty for a long time, and when I entered the webui into the browser I had to refresh several times to get the connection. So please forgive my 'Jonesy' moment ab Ronnie Last edited by The Man in the Van; 2015-09-28 at 07:14. 2015-09-28, 11:45 #3590 Hi, Does volume control take advantage of hardware volume control in HifiBerry DAC+ and DAC+Pro? Now switch to the computer you want to control Pi from. If you are using a Mac or Linux PC then open the terminal. On your Mac, you'll find it in the Utilities folder in the Apps folder. Type the following command in the terminal window. That's a lowercase letter L by dash! ssh 192.168.1.13 -l pi You can also use ssh Note that you will need to replace the IP address above with your Pi. You can find this by running the sudo ifconfig command from the terminal. The -l pi option specifies that we want to log in to Pi as a pi user. The first time you run the command, you'll receive a security warning that you won't be able to verify the identity of the machine, let's say you want to continue, and enter your password (raspberry by default) when prompted. Note that the command prompt changes to indicate that you are now connected to pi. Try using the ls command to display the contents of the current folder on Pi.
