Rooting the Android operating system is the process of gaining full control of privileges and becoming a root user. Having a root account account responsible is the same as turning on a computer that runs under it Windows and logging into an administrator account. You may not know, but when you buy a mobile device that runs Android you don't have access to a root user account. You use the equivalent of a Windows account that has set limits to make it less convincing than an admin account. For android mobile operating system, these restrictions prevent you from being able to install many of the apps that are out there and available to install on your device, and they prevent you from being able to remove existing apps that are running on your device right now. The developers of Google and Android never wanted you to be able to remove the apps that are on the device right now that the manufacturer and the phone network include. It's a quick job for carriers and manufacturers to embed these applications into the system section (hence the name system application) because you can't access a section of the system with the current level of restrictions that non-root Android operating systems have. Similarly, Google and Android developers never wanted to stop you from being able to install any of the apps. What they have done is block any access to the internal system for everything so that malware cannot access the root file system. Unfortunately, many of the apps available need the same root access before they come true. Many developers prefer the Android root because they need to get root access before they can develop anything. In addition, millions of people around the world prefer the root of Android so they can run thousands of useful apps that they otherwise would not be able to work on. Now that you've established a reason for wanting to eradicate Android OS using a tool like KingRoot let's briefly run over what KingRoot and the differences between it and other rooting tools. KingRoot is a versatile rooting tool with one click. We've seen a lot of one-click rooting tools come into life, and none of them arrive with a bold statement that KingRoot has made (that it will root almost every Android device), but they all tend to make you assume they will. such that they are certainly not the root of every android device and KingRoot will be one click rooting tools that root more than any of the others, but it is still far from rooting every Android device. If you're not familiar with one click rooting, then you might be more familiar with names like Towelroot, WinDroid, PurpkeDrake, Framaroot and Wug's Toolkit- all of which are one-click rooting tools as well. With Android rooting there are usually two types of rooting techniques. One is by installing a single-click rooting tool that doesn't require an unlocked loader or custom recovery, and the other by unlocking the loader, installing a custom recovery, and then flashing SuperSU Chainfire when your device is loaded into recovery mode. People who want to install custom DISKS and custom cores often prefer rooting with the downloader unlocked, and custom recovery flashed because they need these two things to install ROM anyway. Anyone who just wants to be installing root apps from Google Play and online like Viper4Android only has to have root access so they often don't mind using a one click rooting tool. KingRoot vs. Magisk vs. SuperSU KingRoot tool is perfect for those out there looking for a quick and easy way to access the root, but it's also important to understand that there are some limitations to its use compared to some of the other tools available today. Root access has never been something that Android developers have wanted you to have since technically it can lead to security problems because apps are no longer trapped in their sandboxes. This means that if you install a malicious application, it can move through the operating system more easily and read information from other applications. When Android Pay came along, this extra ability to read the data of other apps became more powerless, because the last thing Android wants to deal with is people losing money from hackers. Android has come up with a problem solution called SafetyNet that stops you from being able to use any app like Android Pay, having root access at the same time. Most of the tools offering root access don't offer a way around this problem, but some do. A tool called Magisk lets you have root access and then switch it so you can use Android Pay and then switch root access back, so you continue with the root device after you've finished the Android Pay deals. There is no way to have root access and use Android Pay at the same time, so it looks like this type of switch switch that Magisk provides is the way into the future. The traditional SuperSU app doesn't have a way to bypass Android Pay just as KingRoot currently doesn't either. However, you can install SUHide and pair it with SuperSU, that your root access is temporarily hidden rather than temporarily switched off. Both offer a way to use Android Pay so far. KingRoot has nothing like this available yet today where you can keep it installed, turn it off or hide it so you can use Android Pay and then switch it back or unhide again so so can return to using the device with root access. Android is as simple as KingRoot is to use thanks to the fact that a one-click rooting tool is not really something you want to go back and install every day after you've made an Android pay deal. Download KingRoot APK for Android 7.0 Nougam for Root Android devices The KingRoot team has made the KingRoot tool very easy to download and install. But before you can think about it, you need to change one of the settings on the Android operating system so that you can install apps from outside the Google Play Store. The setting is called Unknown Sources, and if it's not on you can only install apps that are available for download from the Google Play Store. Google decides to do this because they are always looking at your security in the Play Store, but they have little control over apps from outside the Google Play Store. So you get a warning when you go to install the KingRoot app and how it's not safe to install, but that doesn't mean the KingRoot app itself; it's just talking about an app that you install outside of Google Play. Since we know that the KingRoot tool is safe, there is nothing to worry about when you install it. To turn on unknown sources, go to the menu of the zgt; security settings and unknown sources and switch to the switch so that it is now on. Now that you have unknown sources included from the Settings app, nothing deters you from getting KingRoot installed. To get started with The KingRoot Installation, download one of the APK files at direct links below. Note: Also, you can open your favorite web browser app- it can be any web browser, so just select the one on your device that you normally use as your portal t Internet aka that you use to make your web browser. Then enter the address rack of the web browser and then press the Enter button on the keyboard. Now you'll see the official KingRoot website uploaded to your device's display. Scroll down a little bit and you'll see a button available to install the KingRoot APK file. The KingRoot website automatically detects when you visit it from the Android operating system and makes the file available. Just tap your finger on the DOWNLOAD APK button for Android. Then you'll receive a thank you message for downloading the KingRoot tool. Click on the OK button available in the bottom right corner of the device's display. Swipe down from the top of the device display so you pull down the shadow notification and then click on the download full KingRoot APK file so that it opens. Have a quick reading of what you see on the display further because it's letting you know everything that KingRoot wants device permissions. You can't afford the luxury of choosing and choosing anything but to go back and not continue with the installation if you're not happy with something, but you can at least do it if you see something you don't want KingRoot to access. If you're comfortable agreeing that KingRoot will access, just click on the Set button in the bottom right corner of the display device and installation is officially underway. KingRoot then gives you a message letting you know what it installs on your device. It probably won't go through the first time and you'll get a message on the device display letting you know that the installation has been blocked. Click on a small arrow next to where it says: More, so you can see more details. You should see another link now that says: Install anyway (unsafe) that you need to press your finger on now, so that the file keeps installing. If you don't, and you just click on the OK button, you'll go back to square and you'll need to click on the downloaded file from the notification form again. The KingRoot app is now installed on your device. All that's left to do now is open it and start using it by clicking on the Open button, which is available in the bottom right corner of the device display again. That's all you need to do to root out Android 7.0 Nougat software updates on your Android mobile device using KingRoot's one-click rooting tool, which can root hundreds if not thousands of devices these days. You can confirm that the manual has done the work for you by installing a root-checking app also available in the Google Play Store. The Android operating system never enjoys the fact that you have root access no matter what tool you used to get it. When you've been using the KingRoot tool for a while, you can expect to get random messages appearing every so often about how you have a KingRoot tool installed and how unsafe it is for you to have it. Again, this is not a message that is anything against KingRoot for saying. It's just a message from Android to try to get you to change your mind about root access. When the device is rooted, it fails to keep apps stuck in their respective sandbox, which is why security isn't technically what it could be if you didn't have an Android root operating system. These messages are trying to make you stretch the device will continue in the future as apps like Android Pay are associated with the use of money and pose a security risk. But apps like Android Pay can't work when you have a root device, regardless of the tool you to get root access. There are tools that offer simple ways for you to temporarily disable root access, so you can use Android Pay and then turn on the turn on access again after you're done, but there's no way not to disable SafetyNet and use Android Pay with root access at the same time. Hopefully the KingRoot tool has come up with a similar solution in the near future where you can switch the switch like Magisk, so you can switch between having root access and using Android Pay. There are many people who love KingRoot because of this does not require much knowledge to use. But for now, there's nothing to worry about, even if you're using Android Pay, because root access doesn't affect it except you're not able to use it. Now nothing prevents you from installing all the apps that won't work on your device before because they need root access. This means that you can choose what is removed and installed at any time or until you have a device that you would prefer to unventure the device again with KingUser. The Google Play Store app that is on your device accepts most of these root apps that we mention, but you need to know the root app names before you can find them, because there is no first page in the Play Store available only to showcase the latest root apps, such as you can see with standard apps that work on all devices. We offer support in this area by providing you with at least 60 of what we consider to be the best root apps for you to install on the Android operating system once you root the user. The official KingRoot thread, which is posted on the XDA-Developers website, invites everyone to give a version of the KingRoot tool that is made for Windows PCs, to try if you didn't have luck with the version that is made for Android. This is the Android version that we have here in the guide above. The Android version is the easiest to install, but KingRoot developers suggest that it is a version of the Windows operating system that may have a better chance of rooting success.
