Xiaomi sub-brand Poco earlier this month launched its first smartphone, Poco F1 in India and other markets. Instead of launching a pristine version of MIUI, Poco F1 runs MIUI for Poco, an individual version of the software on top of Android 8.1 Oreo. Custom Poco Launcher is currently released on Google Play, albeit in beta, Xiaomi. Key features of this launcher include a clean home screen, app drawer, privacy features, and icon settings. The size of the Poco launcher file in the Play Store is expected to vary from device to device. It works on Android smartphones that don't work for MIUI. The Release of the Play Store was promised at the launch of Poco F1 on August 29, the day of the first flash sale of the smartphone. Poco Launcher on Google Play, however, is listed as an unreleased app and early access is full. Interested users can sideload APK directly from APKMirror, as noted by Fonearena. The version listed is 2.6.0.3 and the file size is about 15.5MB. In addition to Poco Launcher, MIUI for Poco comes with certain android features, including quick tile settings and various icons. According to the listing on Google Play, Poco Launcher is a full featured customizable launcher for Android phones. It comes with a clean and minimal home screen, an extensive search feature with app recommendations and icon color categories, the ability to group apps into categories to allow third-party icon packages to be used to customize, and the ability to keep apps closed and animation faster. All in all, it appears to have stripped down the MIUI version, which borrows items from the Google stock version of Android Oreo Ahead from the Google Play list, poco launcher APK beta v0.1.5 was distributed online in the MIUI forum post, and was available for MIUI based on smartphones. Recall, Poco F1 was launched in India at a starting price of 20 999 rubles for an option with 6GB of RAM and 64GB of onboard storage. The smartphone comes in rosso red, Graphite Black and Steel Blue colours, as well as specs including the soC qualcomm Snapdragon 845, dual rear camera setup and display clipping. Poco earlier this week announced the release of the Poco F1 kernel code in an attempt to spur the development of custom ROM for the smartphone.
