Jim Campbell's APK file contains installation files for any Android game. If you have an APK file on your computer, you can copy the file directly to your Android device and install the game without connecting to the Android Market. This process is profitable to test your own custom Android game, or install a game sent to you by a friend on your phone. Connect your Android device to your computer with a USB device. Windows mounts the drive on the Android memory card. Copy and paste the APK file from your computer to the disk installed. Click on the Settings icon on your Android device. In the list of options, tap the App icon. Check the option marked Unknown Sources. This option allows you to install APK files that have not been tested or downloaded to the market. Click OK to save settings. Click Apps again and tap the App Installer app icon. Click on the NAME of the APK game in the app list. Click the Set button to install the APK on your phone. Want to be an Android app developer but don't know how to code? You don't want to learn? Don't worry, there are still plenty of options out there for you. Android app manufacturers are tools created specifically for those people who want to create and release an app in the Play Store (and maybe in other app stores but don't want to participate in Java or Objective-C training. Like building a native app from scratch. However, you may be surprised at how flexible many of these tools are. Depending on the app you have in mind, there is a surprisingly good chance that one of these Android app creators will provide you with all the tools and functionality you need. And in many cases, you can have something up and running at any time at all. At first glance, many of these Android app manufacturers seem to offer the same features packaged a little differently. Dig a little deeper though, and you'll see that they have some pretty big differences. It is important to make sure that you choose the right Android app maker for your own project. In this post, we'll take a pretty comprehensive look at what's out there among application developers and evaluate which tools are best suited for different scenarios. If you want to create a 2D platform game, or you want a top-end business application, you have to find something to suit your goals. The best android app manufacturers without code and creators ofAppYoureIfAppYoureIf developer of HTML5 apps based on Android or iOS. You'll see a lot of HTML5 based on app creators in this list. These apps are more like web pages that are downloaded to web views in apps. This is what allows the need for programming and what makes them cross-platform. This tool is clearly business-oriented, but a little more startup friendly and a little less corporate than other options. The process of creating apps is constantly streamlined and fun as a result, but there are also a few neat features for potential monetization - including synchronization with Open Table and Resimio. Perhaps the most compelling feature, though, is the ability to create your website using a tool and then keep the content in sync with the app. a slightly more run-friendly and a little less corporatePricing is relatively reasonable here, with the most basic membership to create apps setting you back for only 24 euros per month. Full business membership is 49 euros (55 euros) and membership of the company - up to 89 euros (100 euros). The good news is that you can try the tool for free. So the app is silly! AppInstituteAppInstitute is another business-friendly iOS and Android app maker that is easy to get started with and has many enterprise-oriented features. There is a powerful looking feature, such as a loyalty program, GEO lists, social networking integration, analytics, and push notifications to remind users to check your app. Perhaps the most impressive feature is the ability to make transactions entirely through the app itself. Once again, there is a free trial that will allow you to create the app in its entirety. Payment is required only after you decide to go further and publish for 32 pounds per month (\$42). This certainly stands out among many Android app makersAppyPieAppyPie is an app developer from India that once again focuses on simplicity and simplicity. The front page features children running through wheat fields, which is the key to making it a slightly less corporate solution. It's not a screaming app for me, but there you go. This creator of the Android app stands out in a number of ways. First, it gives you a range of templates and features for apps besides purchases and business applications. There's the ability to create your own Fitness Tracker app, for example, or create a birthday app for a loved one. I especially like Kids App Builder, designed to help kids get into app development. There's also a builder game that is based on preliminary templates, but goes beyond the basic word searches etc that you usually see with this kind of builder. Another unique aspect of AppyPie is the pricing structure. While there are usual options for creating an app using app creators and publishing it for different amounts per month, there is also a free option that Ads. You'll also lose the ability to edit the app after 48 hours, but if you just wanted the satisfaction of having an app in the store with your name on it, this is an easy and free way to do it. I wonder what you need to manually send your apps to the Play Store, which both good and bad. There's also a lack of polish in some other areas compared to the slicker offerings on this list. AppMachineAppMachine is an app developer with a number of unique features to appeal to a number of developers and organizations. These include the ability to scan a website and convert it to an app. Designing from scratch is also easy thanks to the use of grabbing together building blocks. The usual features here too, such as maps and support for web services. Prices start at 29 pounds (\$38) per app, per month. ShoutemBack for business-oriented creators of Android applications, Shoutem is a particularly polished and clear app creator with a number of features that will be useful to many users. Specifically, the monetization side of things is handled well here with Shopify integration and support for mobile advertising - meaning that you can sell your product catalog, or make money by keeping your users glued to the screen and showing them ads. It's a nice and simple tool maker as well, with lots of ready-made and smart looking templates to choose from. The problem is that publishing an app will require a slightly more expensive plan, starting at \$49 for Advanced Plan. For the right business, it may be a price worth paying though. Appery.ioAppery.io is one of the creators of an Android app that is powered by PhoneGap, meaning that it has access to some of your phone's most native features, like camera and vibration (see below for more information on PhoneGap). There are also a number of plugins available for further expansion functionality. The builder aims to be more technically minded however and uses a fair bit of jargon that may not be putting for good. If you can get through that though, this is one of the most capable options. There's a free trial, but the pro plan will set you back \$99 a month, making it one of the most expensive choices too. GoodBarberThe strangely named GoodBarber is one of the most capable and multi-communic Android app developers on this list. Unlike many others here, GoodBarber provides native apps written in Objective-C and Java for iOS and Android respectively. This gives it some more advanced features compared to other Android app creators including social media support, iBeacons, Geofencing and more. It can also integrate with Amazon, Etsy and Shopify, and content can be easily updated through the back office. The monthly fee for published apps is 32 euros (36.14 euros) per month. Mobile RoadieMobile Roadie is one of the biggest names in the Android app creators space and has several impressive customers such as and TED. But with these bragadoturable rights you can expect an exorbitantly high price, and that's exactly what you get here. Prices are not currently available on the site (never a good sign), but previously the main membership started at \$149 a month with a pro for just \$799 a month. As you would expect, for this price, you will also get a very professional design and a number of features, but, for the price, I find it hard to see why you wouldn't just outsource the development of a native application for professional service. But hey, if it's good enough for Disney! AppsGeyserAppsGeyser is another of these Android app developers that allows users to create apps for free. The catch that all the apps you create will have banner space along the top of the display ads. What makes it a little different though, is that you'll share 50 percent of your income with the company, but only once your app reaches minimal use. To start earning, you also need to register your own account in the ad network and get your own banner. The slot will display your ad 50 percent of the time and AppsGeyser in the other 50 percent, so it's a little uncomfortable. Of course, don't approach this as a quick get rich scheme. Again though, if you're looking for a fun way to get a simple app in the store, then this is one option. Contribution to a good cause that shovelware! There are a few fun options for what you want to create here though, including a number of simple games (such as word search or quiz) and the ability to turn any site into an app. It won't be for everyone, and the user interface isn't the most polished or up to date, but it's different enough to be worth checking out.BusinessAppsAimed is right on the business crowd, and small businesses in particular. BusinessApps comes with all the features you might expect, including ordering food, loyalty programs, push notifications, analytics, shopping carts, and more. This is perhaps the best feature set for small businesses, and it's backed up by some professional templates as well as a simple builder. There's a free trial, while a paid membership will cost \$300-\$400 a month. This has sky-rocketed since the last time we reviewed this list and while the apps look good, there are no obvious reasons to choose this more than, say, AppInstitute. It also doesn't have quite the list of customers that Mobile Roadie enjoys. TheAppBuilderTheAppBuilder is a business-oriented application creation tool, priced at the equivalent of \$1.70 per user per month. Massive discounts are available to large groups, and demos are available on demand. The tool uses CMS (content management system), which is a bit like WordPress, making it easy to publish the content of your app. Some useful features, such as push notification support and user-generated content, will help with marketing. Although it lacks some of the more advanced seen by other builders, such as in-app purchases or booking forms. AppMakrAppMakr should be included in this list of creators of Android applications as one of the oldest builders in the city. He calls himself the original way of #MakeAnApp and has a lot of a lot support for both HTML5 and native creations. Another nice difference is the price. This is one of the most affordable options around, priced at \$2 per month for major publications, \$99 a year to enjoy Pro Membership, or \$39 monthly for a reseller package. The downside is that it is one of the most clunky and from Android app developers in the city, making this process a little less streamlined and enjoyable. It's a shame seeing how low prices would otherwise make it a good choice for fun DIY projects. BuildFireFinally, BuildFire is another PhoneGap-powered builder app that has some very smart looking templates, a simple builder, and the ability to let the pros handle the design for you if you so desire. BuildFire.js is a feature that impressively enhances the capabilities of this tool as well, allowing you to do things like creating new custom technologies from scratch, or integrating with a user database. It is one of the most powerful and professional tools, and so once again, making it one of the most expensive - costing \$57 a month for the most basic option and \$134 for a professional package. BuildersGameSaladGameSalad is one of the creators of Android gaming apps. And salads too! Okay, it's not really salads, but it's actually one of the most impressive builders on this list. It's a drag and drop tool to create simple games in a matter of hours, and it can serve as the perfect introduction to game design, or even a useful prototyping tool for professionals. Slogan Drag and Drop Programming - No coding Required is pretty confusing, but we get the point. Suffice it to say that this involved another simple and very flexible tool that is also fairly affordable, starting at less than \$17 per month. StencylStencyl is another cross-platform gaming builder for iOS, Android, Windows, and even Flash. You can publish flash games for free, but if you want to release on Android, it will set you back \$199 a year (although you can publish online and on your desktop for \$99 a year). The system is once again very beginner friendly and uses tile-based 2D settings that die out using Lego.GameMaker StudioWhile GameSalad and Stencyl are good in what they do, nor will it probably give you the much needed power and flexibility needed to make an app that will be a big hit. GameMaker Studio from YoYoGames is one of the creators of apps that certainly has that potential though, and has actually helped build some pretty well-known titles such as Hyper Light Drifter. There's no code required, but the ability to dabble in programming is there for those who want Freedom. To publish on Android, you will need to pay one off the board starting at \$99. Consider this is the missing link between something like Stencyl and Unity. But in fact, you may find that even Unity has less heavy code You think so it might be worth a look too! Oh and Unity or Unreal are free to use. What is PhoneGap? PhoneGap is not an app developer per se, but it is worth understanding the role it plays and can still offer a good option for code-photoc. PhoneGap, like many app manufacturers, allows you to create non-native apps using HTML, CSS, and JavaScript, but then bridge this gap to gain access to native features. As it's not really a builder, you'll be doing more website development yourself. You'll need intermediate skills with HTML and CSS to do something functional as well as a bit of technical knowledge, but it can still be easier than starting from scratch with Android Development. PhoneGap is powered by Apache Cordova, and this in turn is what is used behind the scenes to make many of the app developers on this list work as they do. This means that the makers of PhoneGap and Android apps running on Apache (such as Appery.io) offer a surprising amount of support for local features, allowing you to access things like camera, compass, media storage, etc. If you decide to go directly to the source though, then you will get more flexibility and power when building applications. PhoneGap is a cross-platform, so you can create an app and then publish it on either iOS or Android. The development is done through a desktop app and you can use the mobile app to try your creations on a physical device. The best part of PhoneGap is that it's free with zero ads or other restrictions that we've seen, not always so when you use a builder! But while PhoneGap certainly makes the process a lot easier than going native to Android Studio, it still represents a slightly steeper learning curve compared to some of the other items on this list seeing how you need to deal with HTML etc. you might consider this as one jog down from developing the application appropriately. Android App Creators: The Best Choices and Closing Thoughts So You Have: A huge selection of Android app developers offering a variety of features and benefits. Of course, this is a subjective question, but if you want a small guide on which one to choose, here are some thoughts. For most small businesses, my best bet should be BusinessApps. These apps look good, and the supported features are ideal for local businesses that wanted to be able to sell themselves through push notifications and take orders and orders. Prices are also there with the best My pick for the best Android maker apps for businessesThat's for business applications used for market and sales though. If you want an app that will actually do something, then you probably want one of the creators of Android apps powered by PhoneGap, so you can access the camera. For this, either or or BuildFire would be a good choice. But if you're going to have that route, why not just do just a little more training and do something yourself in PhoneGap? You will need to use HTML and CSS, but you will get more functionality and it will be completely free. For vanity projects, one of the free Android app manufacturers like AppyPie or AppsGeyser make more sense. For games and kids, GameSalad and perhaps GameMaker will provide an amazing amount of power and flexibility by being fun and easy. On the other hand, you can just learn to code!
