Double tap the .exe drivers file to start installing. (Not required if you've already done so.) Step 3: Also download Odin PC software (latest version, 3.13.1). Step 4: Remove the firmware file now. You can use free software like 7-zip for this. Set 7-zip, then right click on the firmware file and under 7-zip, select 'Extract here'. You should get .tar.md5 files now. (You can pile files and you'll find text like AP, BL, CP or CSC etc. written at the beginning of these files.) We will download this file to One, which will be installed on the device. Step 5: Remove the Odin file. You have to Odin exe (other files may be hidden, therefore not visible). Step 6: Disconnect your Galaxy from your PC if it's connected. Step 7: Load your device into download mode: Link the device. Wait 6-7 seconds after Goes. Connect your device to your PC with a USB cable when you press and hold the Volume down and Bixby buttons together until you see the Warning screen (image). Click Tom Up to continue downloading the mode. Step 8: Double click on the Odin .exe file (from Step 5) to open the Odin window as shown below. Be careful with Odin, and do the same as said to prevent problems. Step 9: Connect your device now with a USB cable. One should recognize your device. There's nowhere to go without it. When he finds out you'll see Added!! a message that appeared in the log box in the bottom left corner, and the first box under ID:COM will also show no. and turn his background blue. Look at the pic below. You can't continue until you get added!! a message that confirms that Odin recognized your device. If you don't get added!! Message, you need to install/re-install the drivers again and use the original cable that came with the device. Mostly, drivers are a problem (look at step 2 above). You can try different USB ports on your computer too. Step 10: Download the firmware files to Odin. Click the AP button on Odin and then select .tar.md5 on top. See the screenshot below to find out what the Odin window will look like after downloading the files. Click on the BL tab and select a file that starts with the BL text. Click on the AP tab and select a file that starts with the AP text. Click on the CP tab and select a file that starts with the CP text. (Different!) Click on the CSC tab and select a file that starts with HOME_CSC text. If HOME_CSC file is not available, select a file that starts with CSC text. Info: When downloading files, Odin checks the amount of the firmware file md5, which takes time. So, just wait until it's done and the firmware file is loaded. Don't worry if One gets unresponsive for a while, that's fine. The binary size will also appear in Odin. Step 11: Click on the Settings tab and make sure the re-partition box is NOT selected. Don't use the PIT tab, ever. Go back to the log tab now, as it will show the progress of installing the firmware when you hit the start button on the next step. Step 12. Make sure everything is in order, as mentioned above. When you are satisfied, click Start on Odin now to start flashing firmware on your device. Wait until the installation is finished, after which the device will automatically restart. You'll receive the PASS message, as shown below when you successfully install Odin. Some errors you may encounter and with the appropriate solution. If one gets stuck when you connect to the setup, then you need to do it all again. Turn off the device, close Odin, load the device in download mode again, open Odin, and then select the file and flash it again as Above. If you get a FAIL in the top left drawer, then also you need to flash the file again, as indicated just above. Done! Need help? Of course, let him know in the comments section below. Once you install Android 10 firmware, the device will restart. It will take time to reboot, so be patient, and when it's done, it will start optimizing apps, after which you'll have Android 10 running on your device. The One UI 2.0 update is available in Germany, which is one of the European markets to get into the beta program. The beta version was also available in the UK, India and the US, where the next wave of the Galaxy S10 Android 10 deployment is destined. Apparently, Samsung expects to do with the Galaxy S10 Android 10 update in January 2020, but you don't have to wait until you get one user interface 2.0. This is at least true for the owners of the Exynos-powered Galaxy S10e, Galaxy S10, and Galaxy S10. The firmware is available for the German model (DBT), but it should work great for your Exynos S10 device with multi-CSC OXM country code. Aside from Android 10 and One UI 2.0, the update also brings a December 2019 security patch. Now, for the tricky part - install the firmware One UI 2.0 on your S10e, S10 or S10. Keep in mind that this firmware is only compatible with Exynos models, not Snapdragon variants. Once you've downloaded the correct firmware for your device using Frija you've raised higher, follow the steps below to install Update Android 10 on your Exynos-powered Galaxy S10, S10e, or S10. 1.
