House Tour: A Palm Springs home that recalls the Glamour of Old Hollywood's Ultimate Desert Recreation turns into a sexy, chic reality. Ingrid Abramovich Welcome to Design Sketch Class! Sketch is the main skill of the designer. This is the best way to quickly generate, iterate and transmit design ideas to yourself and others. In this class you will learn the basics of how to draw in 2D, 3D, and how to shade a drawing to add realism. Take paper, pencils and your great ideas. Let's design! Enter the Instructables contest! If you used the skills you learned in this class to write a great instructable, try putting it in one of our contests for the chance to win some amazing prizes! Fashion fuse with electrical equipment. I teach fashion design and technology workshops and find this project is an easy dish in paper schemes for those who like to draw and sketch. It can also be used to plan the actual clothing design, which includes wearable technology and test the LED settings in sequence vs. parallel. Materials: Croquis (mannequin sketch - see download) Tracking paper (optional) PenCopper tapeCoin cell batteryPaper clipLEDRound-nose pliers or scissorsScotch tape (optional) Croquis_thunderlily.pdfInuding your own fashion design from your boundless imagination. I've added croquis (mannequin sketch) that you can download to draw your fashion ideas or create your own design from scratch. To reuse the same croquis, you can sketch your paper tracking by placing it on printout. Map where you are going to place LEDs and draw lines for copper tape. When connecting the batteries you should always connect the ground and then ie. To make it easier, connect q ve when you fold over the corner of the paper chain. By placing LEDs in parallel you will be able to run more from your cell coin battery, but this will deplete the current faster. Be sure to connect-ve side of the battery for all-ve foot LEDs and side ies battery for all-leg zwe LED. LEDs light-emitting diodes, and like all other diodes, current travels only one direction from the positive foot, through the diode (lighting it) and from the negative leg. What foot does that mean? The legs of LEDs are different, the longer the leg, the shorter - ve. You don't need to use expensive sticks on LEDs, you can howce your feet with these 5mm LEDs using round nose pliers or even scissors. Curling feet provides a way for them to balance, add a drop of glue to keep them in place. Rest assured that all of The Sound's legs are lined up on one side and all the legs are lined up on the opposite side. You will be able to join all the legs of the ies and will separately join all the legs-ve. Not eva's feet to their feet. Add copper tape, carefully peeling paper paper back, make this section while the tape curls are easy and will stick to yourself. Start laying it on your design, after displaying you've done in step 2.Note that the sticky side of the copper tape is not conductive, so when you come to the corner to fold the tape 90 degrees in the wrong direction and then fold it over yourself in the right direction, so that the outside of the tape is always touching. It's a good idea to add a little tape on it to keep the times in place. Be careful to place copper tape under the feet of LEDs, so that the non-sticky, conductive side connects to LEDs. Again, a small piece of tape pressed down helps provide a connection. Finally bring your design alive. Simply add a coin cell battery so that the positive side connects to the positive legs of the LEDs and -ve connects to the feet-ve. Keep it all in place with a clamp.
