Traditional communication on the project took place within a well-defined structure using channels such as internal mail, telephones, memos and formal meetings. Modern project communications use technologies such as e-mail, intranets and social media to share information within a more flexible team structure. The need for communication has changed as new approaches to project management have been adopted and the need to inform a wider group of stakeholders has changed. The traditional design team processed the project in separate stages, completing each stage before the next one. The team documented each stage and received a sign-off before progressing. According to Project Smart, modern practice is to adopt a flexible project methodology in which project phases can overlap as team members process individual cycles, changing them according to any feedback. This complicates communication by emphasizing status updates and easy access to up-to-date project information. The modern project team includes a broad group of permanent and temporary members. In addition to internal staff, the team may also include consultants, suppliers, business partners and IT service providers. The project manager must ensure that all team members have safe access to the project's communications for the duration of their participation. According to Place, the project is a temporary social system where success depends on cooperation, communication and commitment through transparent information sharing. Modern projects have a much wider group of stakeholders. In addition to communicating with team members and sponsors, project managers recognize the importance of providing full informed information to all stakeholders, including the community, regulators, government agencies and investors. According to the consulting firm Cornwell Management, inefficient communications contribute to the lack of success in more than 65 percent of failed projects. Modern communication of the project uses network communication to improve cooperation. E-mail and instant messages allow team members to share information quickly and easily, rather than relying on paper channels such as internal memos or faxes. Project portals provide a single secure access point for all project information and documentation over the Internet. Video conferencing allows team members to train progress meetings, even if team members are in different locations. Technologies such as blogs and social media further improve project communication, creating a sense of community and enabling stakeholders to provide feedback that could affect the Project Of S. Pendent Development and The Internet has changed the way we communicate with each other. This change applies to personal and business communications. The instantaneous nature of electronic communication has expanded to reach and created a world without borders. There are a number of popular electronic means of communication. E-mail allows you to send a message from your computer or laptop to another person's computer or mobile device. It is one of the earliest electronic means of communication and is still one of the most popular. You can get an email account through work or school. You can also sign up for an account with an ISP or get a free online account, such as a Yahoo account. You can use mailing lists to communicate with a specific group of people. These are groups of people who share some interest. For example, Listserv is an email-based software that makes it easier to send lists that go to a group of people who can be based anywhere in the world. The person who created the list, known as its owner, can set it up as a private list so that only certain people can join the list and view the messages. If the list is public, anyone can join the group. The owner can also set up mail privileges for which members can send an email to a group. Chat rooms provide another tool for electronic communication. In this type of communication, a group of two or more people sends instant messages back and forth. You send and receive messages in real time. To use this electronic communication tool, you will need software such as Internet Relay Chat (IRC). Some ISPs also provide chat opportunities. November 6, 2009 3 min read Opinions expressed by Entrepreneur contributors are their own. Collectors begin to use emails to search for debtors or customers by ingesting in the past. Many people have public social networking profiles that a collector can use to find a postal address, phone number, mobile phone number, place of work and other contact information by searching for these sites. It seems that text messages and emails are becoming the preferred and most effective way to increase collections. I know of at least one collection agency that has seen a 12 percent increase in collections via electronic communication. Email and text messages seem to be a less invasive form of communication than a phone call, and your customers have a sense of what control when and if they respond. Some collectors obtain the customer's consent to the text correspondence before the sale, simply adding a little wording to the credit application. The wording is similar: By signing this document, the client agrees to accept and understands that text messages can be used servicing the account, including debt collection. Others have taken it one step further by adding a more detailed plan of how text messages will be used and with customers to sign and recognize the following provision: You customer allows us (company name) to send you (customer) a text message on a mobile phone number on which we reasonably believe we can contact you for any legitimate purpose, including but not limited to: Suspected of fraud or identity theft on your account Getting the information needed to service your account Collection on your account Notice of important issues relating to your account. If this is what you are considering, it is important to remember that all messages should include a mechanism for the consumer to opt out of receiving further text messages at any time. This protects the consumer as well as the collector, especially since the law does not specifically address text messages sent as a form of dunning. If you choose to send payment alerts to customers via text message, it is imperative that the customer is not charged with the text and that your company bears any costs associated with the text. Here are some dos and don'ts to use electronic communication in your debt collection efforts: Do Carolyn lagattuta/Moment/Getty Images Electronic communication allows you to share information both synchronically and asynchronously over long distances and in a large number of formats, but the disadvantages include security issues, lack of access and potentially misunderstood messages. This type of communication offers people many new ways to communicate ideas and data. Synchronization of communication requires that people be available at the same time, for example, for telephone and web conferences. Asynchronous messages, such as email, text messages or social networks, allow people to access information at different times, but it takes longer for everyone to get on the same page. Synchronized communication allows people to immediately share information by having to coordinate schedules so that everyone is present. In addition to the various advantages and disadvantages of synchronicity, electronic communication has more general advantages and disadvantages. Electronic media vary greatly, meaning that the environment can be made to match the message. When the text works well for the message, it can be sent by email. When a message requires people to see each other to prevent misunderstandings, web ingested is more appropriate. Electronic communications cover the whole world, not worth much more than Internet services and computer. Electronic communication requires security to prevent viruses and other malicious software, and even a good virus protection system cannot prevent problems due to spam or phishing emails in which the reader clicks on a link or provides personal information. Because human communication involves much more than words, readers may misunderstand emails and text Messages.
