Snapping and sharing screenshots is invaluable. If you need to offer a quick bit of technical support to a customer or fellow employee, document procedures for in-house guidance, or produce professional-looking screenshots for a promotional site, these handy utilities will help. Some are cross-platform, and most of them are free. Snagit \$50 Snagit bills itself as the ultimate screen capture tool, and it's really a powerhouse. The Snagit interface is divided into a capture utility and an image editor. The capture tool works with presets: You can decide whether you want to capture the mouse cursor along with the screenshot if you want a capture delay, and even grab a scroll box (Snagit will scroll it for you and produce one long image). The Editor of Snagit is complete and versatile. The Snagit editor is just as powerful, allowing you to apply effects such as drop shadows, size changes and crop image, add text and callouts, and more. Because of this division of labor, you can use the editor to annotate screenshots taken using other tools, too, and even just photos. Because Snagit is trying to do so much, it's not the most elegant of the tools. Chances are it can do whatever you need, but this flexibility means there are a lot of tweaks to tinker with. Screenpresso At \$24, Screenpresso Pro is cheaper than Snagit, and certainly doesn't have its long history and name recognition. Once you download it though, you may find Screenpresso no less powerful. In fact, Screenpresso often feels more polished than Snagit, both in terms of the workflow and output it produces. The Screenpresso image tray allows you to view screenshots that have been taken before. Just like Snagit, Screenpresso is divided into a capture interface and an image editor. While Snagit shows you previously captured screenshots in the image editor, Screenpresso uses the capture interface as an image tray, allowing quick and direct access to previous screenshots without having to open the editor. With an open tray, you can view past screenshots and drag them into email or elsewhere. Screenpresso and Snagit image editors contain built-in image annotation tools such as stamps and calls. This means they have their own different views: Someone who is familiar with Snagit is more likely to quickly recognize a Snagit-edited image. Because Screenpresso isn't as well known, it gives your screenshots a more unique look. Last but not least, both Snagit and Screenpresso can capture video screencasts-very convenient to demonstrate features or ask technical A screenshot of Captor compared to both Screenpresso and Snagit, the Captor screenshot feels utilitarian and challenging. But it's also very powerful, and perhaps more importantly, it's free/donationware. The Captor screenshot has it all The same capture tools are Screenpresso and Snagit feature, including scrolling capture. In fact, its scrolling capture feature is even made by Snagit in the PCWorld review of the previous version. The screenshot of the kidnapper looks utilitarian, but powerful and flexible. Unlike Screenpresso and Snagit, the Screenshot Captor interface consists of one main window. You can additionally show a subtle quick grip bar that floats over all the other windows, allowing you to initiate grips with a single click. The bar is optional because you can trigger grips using keyboard hotkeys, too. If you prefer a more traditional look at your utilities, or want to try a powerful free tool before shelling out money for a commercial alternative, you should try Screenshot Captor. If you think it's useful, think about donating to a developer. Jing TechSmith, the creators of Snagit, understand that not everyone is energy intensive. Many of your colleagues probably just want a quick and easy way to capture a random screenshot or screencast, for technical support or demonstration purposes. That's where the free Jing tool comes in. Installed, Jing appears as a virtual sun, a small glowing circle at the top of the screen (rather than in the tray system, like most other screenshot applications). Hover over this sun, and it shoots from three rays: Capture, Story, and more. The Capture option is as simple as it could be. Just select the area and decide whether you want to save it as an image or video. Unlike the apps mentioned above, Jing does not automatically detect window boundaries and other controls. It won't snap up to the size of the window or toolbar you hover over. After capturing the image, Jing offers some rudimentary annotation tools as well as upselling you snagit through custom Change's Snagit button. You can also share an image through TechSmith's Screencast.com service, tweet it, post it on Facebook, copy it to a clipboard, or simply save it as a normal old file. Any of these operations takes only one click. Puush and Snaggy What if you never need to annotate your screenshots at all? What if all of these options are just redundant and all you're looking for is a way to quickly share screenshots with colleagues and others? Puush is a simple app for snapping and sharing. In that case, you're looking for either Push or Siggy. These two services emphasize the dizzying speed and absolute simplicity in the configuration: you can't record a video or annotate anything, just share your screenshots. Puush is a tiny Windows that sits in your system tray. Hit the hotkey, and the image is being actively snapped and uploaded to the , and its URL is copied into the clipboard. This happens in a fraction of a second. Literally, you press a button and get the URL you insert in an email or chat message right away. Other hotkeys allow you to capture and download the entire desktop, a specific region, the contents of the clipboard, or even a file from your computer. Extremely fast and simple, and if you don't remember hotkeys, you can always right tap the system tray icon and choose the option you need from the menu. Snaggy is even easier than Puush, in that there is nothing to download and install on your computer. Just copy the image to the clipboard (any image, there should be a screenshot), go to Snag.gy, and hit Ctrl-V. Your image will be pasted into Snaggy and you'll get a URL you could share with others. If you want to crop or edit an image, Snaggy has a rudimentary web image editor. Sharing images with Snaggy is as simple as cutting and paste. Whatever your screenshot needs, this range of tools probably has at least one option that fits well. You never have to open MS Paint to paste on a screenshot ever, ever again. These tips are a tool nugget of wisdom from experienced pros, experts and smart readers. They will save you time, effort and money. According to DIY family expert Handyman MagazineYou can also sniff: TBDA is a quick way to cut brickScore and break the brick in just seconds with the diamond blade in the corner of the grinder. Angle grinders are convenient tools, especially if you're working with tiles or Here's how to use one to cut bricks if you don't mind a little rough edge. Equip the meat grinder with a diamond blade and then score the brick on your back about 1/2 inch deep where you want to break. Put the brick chisel in the account, give it a kick, and the brick will break. I worked in magazine (and now website) for 20-plus years and learned passel is a great tool of tips and techniques during this time. For this issue, which is all about tools, I rummaged through deep archives to get some of my personal favorites. They cover homes and stores, indoors and out. I hope you learn as much from them as I did. If you want to get power into the pond or just want an outlet in the back 40, you may have to run the wires under the sidewalk. Here's how to do it. The idea is to drive 1/2 inch long of a hard electric pipeline under a walk. You will need a lid from both ends of the pipeline: one end to hold the dirt, the other so you can pound on it without damage. We recommend 1/2-in. connect and connect at both ends. Lift the channel off the bottom of the trench with some blocks, and kick away. Video: Hand tool hacks and modifications for woodworking-and-dirty support long boards Ladderuse stairs like a pair of extra hands while cutting long things. Okay, we recognize that a proper miter saw the stand better, but if you're just cutting a couple of long pieces, here's a quick way to support them. Just clamp a piece of scrap on the back legs of the stepladder. You will have to snake the boards through the stairs to support them, but the ladder is a solid rock and you can customize the support piece so it is perfectly level with the saw table. Mark the pipe before gluing together the joint alignmentMark your tubular joints so you can unwind them quickly when gluing. When you are working with PVC pipes, dry fit fittings and pipes to make sure they are in the right position. Use the level where appropriate. Then tick off the pipe and fitting so you can get them back to exactly the same position when you are bonding the joint. PVC cement sets up quickly! Dry concrete for the pillars of the fence Moisten dry concrete mixture around the post and moisten it after assembling the fence. If you place fence pillars in concrete and you want to get the job done quickly, you can sometimes brace the pillars and pour dry concrete mixture around them. Keep it a couple of inches below the soil line. Continue the carpentry business, and when you're all done, soak the top of the mixture in each hole. You don't have to move. The top will be installed quickly, and the dry mixture below will slowly absorb moisture from the soil. Mark on the camouflage tapeMark on the camouflage tapeMeik cutting marks on the camouflage tape. Then remove it after making the incision. I use camouflage tape more for marking than for camouflage. This is useful when the surface is dark and will not show pencil lines (e.g. laminate shown) or if you want the sign to be temporary, such as when you are marking the stud position on the wall. You can use it to mark the cutting line and just cut through it. On Na You can use a white ribbon of a delicate surface. Use epoxy resin to hard-to-clamp joints Tolaing the side of the railApply quickly installing epoxy resin and press the joint tightly together until the fast-setting epoxy hardens. Sometimes you come across wooden joints that are very difficult to clamp, such as the odd angle miter shown, or very small pieces of finish. That's when quickly installing epoxy resin comes to the rescue. Mix it, apply on both surfaces, and keep the pieces together in the exact position you want until the glue sets. You can use 90-second epoxy resin, or if you want more power (and you have more patience), use a five-minute variety. Two tapes for a large layoutSy perpendicular linein two tapes to set the perpendicular line quickly and easily. Use two tapes to mark the perpendicular line on a large layout. Mark the approximate central point on the baseline and then mark the endpoints a few feet from each side of the central point. Pull the two tapes and adjust them so that the ends are at the endpoints, and the measurements are identical where the tapes intersect. That's where to mark the perpendicular line. Snap a line and you're done. Lock the pliers for pulling nailsPull headless nailLock pliers tightly on the nail shank and snatch it from the pry bar. Vise-Grips lock pliers are a great tool for pulling nails. I use them in three situations. The first one shown here is to pull out a stubborn nail that has lost its head. Second, pull trim gun nails that have such a small head that the hammer can't grab it. The third is to remove the nails that remain in the finish you remove. In this case, it is best to pull them off your back using lock pliers. My favorite type is shown: The curved ends of the jaws make it easy to lever out the nails. Burnish external miter to close it to a small gap in the miter joint slightly rubbing over the sharp edge. Sometimes just the act of nail miter joint makes it open a bit. If the gap is not too big, you can close it by rubbing the sleek metal tool hard against the corner. It pushes the wood fibers inside. Almost any tool will work as a utility knife is shown, or a round tail screwdriver. The glue hanging follow the hollowBaseboard braceClose small gaps along the pendant with glue and a temporary brace. The walls sometimes have gentle hollows that are not obvious to the eyes, making it difficult to attach the finish without leaving a gap. If the finish is generally flexible, you can apply the building glue to the top and bottom edges and then figure out a way to put pressure on it. 2x4 against the floor running Crown, and for the baseboard you can cut a couple of scraps and nail them to the floor at an angle. The ideal position is to handrail the RailUse ladder board and frame the area to create anchor points for the handrail. Building codes usually require handrails to be 34 34 38 inches above the leg (cutting edge) of stairwells. But how do you figure that out and also get handrail braces over studs? You can draw all kinds of lines all over the wall, or use the method shown. Mark the vertical line where your studs are, lay 1x2 on the stairs, and slide the framing area along the 1x2 to the end of the 2-foot area hits the stud line. For a little more height, use 1x3 or 1x4 instead. Shim with screwShim baseboardTurn screw in or out for support and smooth the board against drywall. If there is a gap, sometimes the drywall screw is the perfect adjustable shell. For example, when you apply a hanging, drywall at floor level is often dried backwards, making it difficult to get hanging corners to line up well. A pair of screws driven to the bottom of the wall quickly solve the problem, and do so much faster than filling the area with a joint connection. Make a circle with a square out of the circle Mark circle with two nails and framing the square. Here's a tip for laying out small circles or parts of circles. Tack two nails to set the diameter you want and then rotate the framing area against the nails while you hold the pencil in the corner of the square. You may have to rub a little wax or other lubricant on the bottom of the area so it slides easily. Don't ask us why this process works; everything we know he's doing. Hand screws for a quick visehand screw tyzawhren a pair of hand screws on the board. Then clamp them. Old-fashioned hand screws still have a place in the DIYer toolkit, for several reasons. Here's one. You can make a quick grip to hold the board on the edge with a few side screws and small bar clamps. Set the hand screws to about the thickness of your blank, clamp them down and you're going to go. You can use the same trick for the doors, but clamp the hand screw so it extends past the end of the sawhorse. Use the alignment of cleatsAligning edges tile Use temporary cleat to support and perfectly align the tile. Tacking on cleat is one of the most tame tricks in the book. Use cleat to align tiles, as shown on the shown, or cabinets, closet doors or anything else that needs to be lined up or level. Cleat often serve to hold things, free your hands to attach them. Nails, trim, fill, finishFill nail holesMix several shades of putt exactly match the color of the tree around the nail hole. For natural finish and wood, it is best to wait until the first layer of stains and varnish on the tree before filling the holes for the nails. So the tree is close to its finishing shade and color and it is sealed so the putty stays only in the hole. Get a few shades of putts and mix them until they match the wood. Calibrate the lawn spreaderCalibrate your spreaderMeasure your broadcaster to avoid over-fertilizer. If you have a broadcaster, there is to obtain the most uniform application of fertilizer with it. Clean the road first. Then fill the dispenser, dial in the appropriate setting and spread some fertilizer on your road at a normal walking pace. Measure roughly how far the fertilizer spreads on both sides (usually one side should be wider than the other). Write a measurement on a piece of duct tape at the top of the distributor and use the information to guide your app. Sweep fertilizer on your road and discard or reuse. Install the door with an angular cleatsCleat door to stopUse cleats exactly to keep the joint in place when installing it. To install the interior prehung the door, the slick trick is to screw cleats through the top two corners, and 1x4 cleat through the hole of the feet above the floor. Hitting the doorway against these cleats will ensure that it is parallel to the wall. If you shell out cleats with a few sheets of heavy paper, the joint will remain a little proud of the drywall, so that the door enclosure fits nicely and snugly.
