There are dozens of Android phones on the market right now, and while a plethora of sites will calculate the best based on a list of box verification features like processor speed, screen size, and battery life, we want to know which ones you think are best in class. It doesn't have to be the phone that you're carrying, or even the phone that you owned, maybe it's the phone that you plan to upgrade when you can. Whatever it is, we want to know which phones you think are the best, and why. Our only condition: It should be on the market now. After all, we recently asked you which android phones you use, and then we reviewed which phones are most popular among Lifehacker readers. Also, it's been a while since we last talked about the best Android phones, so we're definitely due to upgrade. Leave your candidacies in the debate below! One of the best things about Android is the choice you have between tons of different devices, and... MoreSing contenders is closed! To see which of your nominees are in the top five, head over to the top five Android phones: the 2013 Edition to see which made the cut, and vote for your tota favorite to win! There are so many Android phones on the market that choosing the best can mean a ton... Read more about the five nominations in the discussion where you placed your favorite tool to work with. We get hundreds of nominations, so to make your nomination clear, please include it at the top of your post as well: VOTE: BEST ANDROID PHONE. Please do not turn your voice in response to another person. Nominations by email will not be counted. Instead, make your vote and respond to individual discussions. Once you've made your nomination, let us know what makes it stand out from the contest. About Hive Five: The Hive Five feature series asks readers to answer the most frequently asked question we get: Which tool is the best? Once a week we will put out a call for applicants looking for the best solution to a particular problem, then you tell us your favorite tools to get the job done. Every weekend we will report to the top five recommendations and give you the opportunity to vote for what is best. For example, check out last week's top five coffee makers. Whether you're dribble, French press, AeroPress, pour, percolator, or use a pod brewer, there are MoreThe Hive Five based on reader nominations. As with most Hive Five posts, if your favorite stayed away, it's not because we hate it, it's because he didn't get the nominations needed in calling for job applicants to make the top five. We understand that this is a bit of a popularity contest, but if you have we want to hear about it. Is there an offer for Hive Five? Email us at tips@hivefive@lifehacker.com!Photo Steve Wright, the younger Nokia, may have released a dubstep version of their iconic ringtone, but no doubt no doubt ringtone you can have this one that you made yourself. Here's how to turn any MP3 into a ringtone for free on both iPhone and Android. Bell Icon Everaldo Coelho via Iconspectia.Make iPhone Melody with iTunesWhile you can convert songs into tunes in iTunes for \$0.99, you can just as easily do it for free with a few clicks. To do this, you'll need an unprotected song on iTunes (i.e. .m4a or .mp3, not .m4p). To turn it into a ringtone: Find the song section you want to use as a ringtone, and mark the start and end time of this section. It should be less than 30 seconds. Right click on the track and click Get the info. As part of the Settings tab, set the start and stop times to the correct ringtone values and start OK. Click the right button on the song and select Conversion of Choice in AAC. If you're instead written to convert to MP3 or Apple Lossless, go to iTunes' Preferences, take import settings and switch to AAC Encoder and try again. You should see a newly converted pop-up file in iTunes, and it should be much shorter than the original. Click on it and select Show in Windows Explorer (or Show in Finder if you're on Mac). Change the file extension from .m4a to .m4r. Go back to iTunes and remove a shortened version of the song you just created. Since you changed the extension, iTunes won't be able to find the file and simply delete it from your library. Then go to the file to add the file to the library and go to the .m4r file you just created. It should appear in the iTunes Melody section.The next time you sync your iPhone, your new ringtone should appear in the Settings of the zgt: Sounds of zgt; ringtones. If you want to set different tunes for specific contacts, you can go to the Contacts app, edit the contact you want to change, and choose the ringtone for them under Ringtone. If you want more subtle control over when your ringtone starts and ends, you can use GarageBand too, but only if you're on a Mac. The above instructions should work for users on both Windows and OS X.Apple has introduced a simple and free way to create and sync their own custom tunes for... Read moreMake Android Melody with RingdroidOn Android, you can download one of the many apps to create a custom ringtone. We're going to use The Ringdroid. Once you've downloaded it and installed it from the market, the process is simple: Open Ringdroid. You'll see a list of every audio file on your device (if the songs you want to use aren't on your device, you'll have to transfer it to your device). Choose the song you want to play and let Ringdroid download it. Tap and drag two sliders to choose the part of the song you want to turn into a ringtone. It can be any length. You can click Play at any time to hear it from the very beginning of your choice. Hit the Save button and give the ringtone a name. Now he'll appear in ringtone the phone menu. To install a ringtone for the entire phone, just head to the set-up of the zgt; Phone Ringtone. If you want to set it up for a specific contact, you can just open this contact in the Contacts app, click the menu, choose options, and click Ringtone.There are many ways to create your own ringtone on both platforms, but these are two fairly simple options that don't require paying money. Just make sure you keep your phone on silent or vibrate when needed, there's nothing more embarrassing than being the guy who pocket starts singing Miley Cyrus in the middle of Starbucks. Is your own preferred method of creating a ringtone? Let us know about it in the comments below. You can contact Whitson Gordon, author of this post, whitson@lifehacker.com. You can also find it on Twitter, Facebook, and lurking around our #tips page. Source: Android Central Ramping Ringer rolls out all four generations of Pixel phones. This update is independent of getting a November security patch and can appear in sound settings at any time. After receiving a phone call, the phone will vibrate for 5 seconds and then start playing the sound ringtone after that. First vibrate, then call. This is M.O.'s latest behind-the-scenes update to Google's Pixel, which debuted without any fanfare at all. XDA developers found this feature during the Android beta, but Google hasn't officially implemented it until today. All generations of Google Pixel phones seem to get a feature that can be found in system settings, switch to Sound, Vibration for Calls. A new option, explicitly entitled Vibrate First, the ring gradually basically explains it all. When someone calls your Pixel phone, it will now vibrate for 5 seconds before emitting any sound ringtone. Even then, the ringtone will ramp up the volume as you constantly ignore the person so desperately trying to reach you. This is a fantastic addition for many people as a loud ringtone can often be embarrassing in a number of situations, especially those where you had to set your phone silent. This gives users a few seconds to figure out what's going on and silence their phones until the moment at hand is so rudely interrupted by an intrusive sound. Given that my Pixel 4 XL is still on october security patch and hasn't received the last November patch yet, this update has nothing to do with having the latest version of Android on your phone. It's all up to the masters at Google to flip the switch on your device, so if you don't already have the ability to set up the sound, be sure to periodically check during the day. iTunes can't sync your music library Android device, and Google doesn't offer a desktop app in the style of iTunes. However, there are several ways in which you can easily convey your music to music on your Android smartphone or tablet. The Google Music Manager app even integrates with the iTunes music library, automatically copying music in the cloud so you can stream it from anywhere and easily upload it to Android devices. Download your music to Google Play Music, Google Play Music, a service like Google's music locker, as well as Apple's iCloud. Google provides a desktop app known as Google Music Manager that can be installed on Windows, Mac and even Linux. Google's music manager scans your computer for music and uploads it to your Play Music account. The app also functions similarly to iTunes Match - if it finds songs he knows about on a hard drive, it will automatically match songs with its copies in Google Music, saving bandwidth and time by avoiding downloads. If he finds music he doesn't know about it, he will download your copies. In addition to browsing folders, Google Music Manager can also watch your iTunes library or Windows Media Player and automatically match and download your music. (Music files with DRM are not supported.) Please note that Google Play Music is only available in some countries. You can have up to 20,000 individual songs in your Play Music account. To get started, install the Google Music Manager app on your computer. Let him know where you store music, either on iTunes, Windows Media Player, or in custom folders. It will automatically scan locations and upload music to your Google account. The Music Manager app automatically runs in the background and continues to work, automatically uploading new music to your account. Once downloaded, you'll find your music in the Play Music app, which is installed on many Android devices. If it's not on your device, you can install it from the Play Store. You can transfer your entire music collection from anywhere, assuming you have data or Wi-Fi access. Click on the header at the top of the screen to switch between All Music and On Device. To store music offline, so you can play it without a Wi-Fi connection or using any precious data, long click an album or song and select Store on your device. Android will download a copy of your music, allowing you to play it anywhere. You can put music on your device and even listen to the entire music library when you have an internet connection - don't mess around with cables or transfer music back and forth required. Downloaded music is also available on Google Play Music on the Internet, where you can stream it from anywhere. If you want to download music, you can use the Download button to my library in Google Music Manager. Copy music files over manually The above method is Google's preferred method of putting music on your Android device, you can still do it the old way. Connect Android to your computer with a USB cable. Using Windows to copy music files into the Music folder on your device. You can also use the great AirDroid to copy songs and other files over Wi-Fi without even connecting your phone to your computer. Then you can play music on your Android device. The Included Music Player Play Music will pick up music you've copied by hand, as well as a wide selection of third-party apps for music players. You can store music on Amazon Cloud Player and use the official Amazon MP3 app to play on your device. You can subscribe to a music service like Spotify or Rdio to access millions of streaming songs and be able to download something to listen to offline. You can use a streaming app like Pandora or TuneIn Radio to listen to music anywhere you have an internet connection. You can even use a third-party desktop app like DoubleTwist, SnapPea, Synx, or even Winamp to sync a collection of desktop music on your Android device if you want an iTunes-like desktop sync experience. Android may not have iTunes, but iTunes is a clunky desktop app that many iPhone users who use Windows don't like anyway. The future is wireless. Image Credit: Alexander Stubner on Flickr Flickr
