One of the practices that has become quite common in recent times is the certification of superusers on Android devices and the process of performing the root, which previously required advanced knowledge from users who decided to abandon the device warranty, has become much easier. But what is the root? Root is nothing more than a process that generates admin permission to obtain superuser licenses and allows the installation of independently designed apps that are not part of the Google Play Store on Android smartphones. The significant increase in the number of programmes devoted to this operation is proportional to the high demand for services requested by SU (superuser). However, those who do the procedure are in danger. The price a user pays for the Release of Android may be, in addition to the loss of warranty, as well as the commitment to the device's software. However, for those who can't resist the temptation to install, for example, themed interfaces that require access to the root of the device, or have unlimited access to all available apps in the world, check out some apps that don't require any specific knowledge and, with multiple commands, can unlock your smartphone. But keep in mind that after performing the root, the warranty that the manufacturer gives your phone is automatically lost and the program used to create a SU certificate can damage the mobile software. The apps responsible for the root operation are installed via computer or APKs. So you have to allow downloaded apps from unknown sources on your smartphone. To do this, go to Device Settings and go to the lock screen and security option. Then find the Unknown Sources item and turn on this feature. Roots Of the following applications are capable of performing a root operation, some of which require only a few commands, while others have to work through a computer next to a smartphone. The main advantage is the ability to add custom ROMs to your smartphone or tablet, allowing you to add a few more spices to your device. Rooting can also allow you to unlock some important features of your smartphone or tablet, so the benefits aren't limited to just flashing custom ROMs. For example, there are some apps on the market that can only work with devices that are rooted. These apps offer box-to-box features compared to non-indigenous applications, and can sometimes be considered unstable. With that in mind, we offer to root only for developers among us or those who can afford to keep a spare phone just for rooting. Now that we know why and how rooting can help customers, we will talk about how. Old methods required customers to install the app on their PC, connect the phone, and install drivers manually. Today, the process is much simpler and rooting the phone can be done without requiring a PC. We'll talk about some services that help you eradicate your phone without requiring root access. How to eradicate Android without a PC in 2018Backup, backup and backup! It is important to understand that before you root anything, you should always back up your smartphone. The big problem with rooting your smartphone is that it can take a turn for the worse very quickly. If not done properly, rooting your smartphone can include bricks-and-mortar of your smartphone, which can turn your phone into something as useful as a press paper. In other words, the root of your smartphone is wrong and you can completely destroy it without being able to go back. So while backing up your smartphone won't save you from things other, it will at least save your data. This way you won't be lost on the memorable photos, music or videos that you like to keep with your forever. Android has a way of backing up content by default, and that's through Google Drive. It's usually automated and you just have to make sure it's checked in the Settings app. However, you may want to consider using other phone backup apps, such as through Dropbox or another cloud service on the market. Got your phone and important backup data? Well done! We can start rooting for your phone! Universal AndrootComing as our number one choice, we look at an all-in-one app called Universal Androot. This makes it easy to eradicate the device without using a computer of any kind. The app itself is actually quite old, but Universal Androot says it should be easily compatible with Android phones and firmware versions that are older. You may have rooting problems for, say, the all-new Samsung Galaxy s10, however. However, it's a try and a true app that's worth a try! You can grab the APK here. KINGOROOTOne click root apps are available in abundance today. One way developers can differentiate their products is by offering features that appeal to the masses. KINGOROOT is one of the such applications as it comes with a pretty intuitive interface and the ability to quickly eradicate the Android device. The app can root almost any Android device you throw at it, although there are going to be a few notable exceptions. Developers are updated with the latest firmware, which means that the app also supports rooting Android Nougat smartphones. It is a function that many apps have to offer right now, making KINGOROOT quite popular on the market right now. If we talk about the shortcomings, then, frankly, there are not so many. You'll have to deal with a bunch of annoying ads every now and then, however. But since it's a totally free offer, we're not sure it's much of a drawback to being honest. You will need a stable Internet connection to use the features of this particular app. Because root apps are not allowed in the Play Store, users will have to manually download apk files to their devices and install the app this way. ONE CLICK ROOTThis is a fairly popular easy root app that has received feedback from several happy customers. The app offers an easy-to-use user interface, giving you accurate information about exactly what you want. If you find that the app isn't working the way you planned, there's a live chat app and messaging service in the app to get support from the development team. The app is highly recommended for users who are new to rooting ideas. While we suggest beginners stay away from rooting the device if the situation requires root on their phones, this app comes highly recommended. As with any root app, not all smartphones will be compatible with this particular app. You will just have to install an apk file, open the app and see if the device can be rooted with this app. Naturally, the app will have some ads, which is the only source of revenue for some of these developers. However, it doesn't come in the way of the user experience in any way, so we don't mind it all so much. The app will require an Internet connection to work. FRAMAROOTA is a more polished version of the apps that we talked about above, FRAMAROOT is a decent root app that offers root support for a single touch just like the apps we discussed above. If you're not happy with the root experience, you can just unsalt your smartphone from the app, which is a handy feature to have. The app is free, although there doesn't appear to be any ads. Anyway, not intrusive. Naturally, this app does not require a PC to eradicate the device, so it is pretty much like any other application. The app, however, only works with devices running Android 4.0 and above. It is also important to note that FRAMAROOT does not work with some of the new Android smartphones that are available on the market today. With that in mind, we encourage users to carefully select an app designed for their devices. There's no find out for sure, but it can help try a few single click root apps to choose the best one. If you don't have any of the modern smartphones, however, you should be able to get root access on your Android smartphone/tablet. Don't forget to check out this offer. No4ROOTThis is another popular root application that can be downloaded as an apk file. Oddly enough, the app was available Play Store until recently, but naturally Google got it removed soon. It's a free download, of course, although you'll have to deal with the usual ad stream. Given the huge number of root apps available online, it can be quite a ask to choose the best one. Personally, I feel that No4ROOT is a decent alternative to any of the apps mentioned above. Don't forget to download the app here.
