This removes the Target Old SDK warning app when installing this app on the latest Android devices. Added support for downloading HLS audio. This corrects the link generation error for Soundcloud.Runtime Permits here. The app only requires storage permission for full functionality. Better grouped notifications. Interrupted and completed notifications are grouped into two separate sections. On pre-Android 10 devices, the app doesn't run the entire process in the background for Copy Link functionality, instead it launches a lightweight process that saves a lot of battery life. On Android 10 devices and above, the link copy detection feature is not available because the supported API has been removed by Android. Instead, when you share a link from the side of the app, chose to download/watch with a videoder from the exchange menu to download/view the media. Reduced app size by 15%. A lot of bug fixes and battery optimization. One of the 7 great greats The land of the Continent is the name of the supercontinent, existing 200 million years ago when all modern continents were connected. Pangea Theory that continents are slowly moving to their current locations and continue to move. Continental drift theory Process, by which a new oceanic crust is formed along the middle ocean ridges and the old crust, departs from the ridge. The theory of the spread of the seabed Is a long narrow mountain range found on the ocean floor. Mid-ocean ridge Distance from the ocean surface to the ocean floor. Depth Event, which causes the magnetic field to change its direction. Magnetic reversal is the Tectonic boundary, where the two plates move away from each other and a new crust is formed from magma, which rises to the Earth's surface between two plates. Divergent Plate Boundary The transmission of thermal energy, which is the result of heating the magma, less dense and eventually cooling on the surface, becomes denser and sinks. The current is the current of the Current Separation of the Earth's outer shell, which glide over the mantle. The tectonic plate is a rigid outer part of the ground consisting of bark and upper mantle. The lithosphere layer of the Earth's mantle, below the lithosphere in which there is a relatively low resistance to plastic flow and convection, is thought to occur. Atensphere Process, in which a dense oceanic crust is forced under the less dense continental crust of Subduction Page 2What was called a supercontinent? Pangea This ring contains most of Earth's volcanoes. What's it called? Pacific Ring of Fire What was the theory that all continents made one big super continent called? Continental drift Underwater mountain range. Mid-Ocean Ridges Where a new oceanic crust is formed as a result of volcanic activity and then gradually moves away from the Ridge of the Sea-Floor Spreading Study of the record of the Earth's magnetic field in rocks, precipitation or archaeological materials Of the Paleomagnetism Theory, explaining the structure of the earth's crust and many related phenomena as a result of the interaction of rigid lithospheric plates that slowly move along the main mantle. Converged border These borders slip past each other. Transformation of the boundary of the earth's crust, where tectonic plates meet. The subduction zone is a movement caused in the liquid by a tendency of hotter and therefore less dense material to rise, and colder, denser material to sink under the influence of gravity, which therefore leads to the transfer of heat. Convection crack, split, or break into something. Break the hard outer part of the earth, consisting of the bark and the upper mantle. The lithosphere is the upper layer of the Earth's mantle, below the lithosphere, where there is a relatively low resistance to plastic is believed to be happening. Atensphere Top layer of the oceanic part of the tectonic plate. Oceanic crust Is a relatively thick part of the Earth's crust that forms large landmass. It is usually older and more complex than the oceanic crust. Continental crust Sudden and cruel shaking of the earth, sometimes causing great destruction, as a result of movements inside the earth's crust or volcanic action. Earthquakes of a mountain or hill are usually conical, having a crater or ventilation through which lava, fragments of rocks, hot steam and gas are now or have been erupting from the earth's crust. Volcanoes curved a chain of volcanic islands located on the edge of the tectonic plate, usually with a deep ocean trench on the outcrop side. Arc Island
