Tiny Scanner is a free app that lets you scan documents directly from your phone. You can turn them into a picture or PDF in any color you want, whether it's greyscale, black and white, and so on. Scanning has never been easier, given that you only need a phone to do the action. Tiny comes with a solid selection of features such as automatic edge detection and quick document search. It's pretty easy to use, with only a few buttons available and no unnecessary complications. However, one thing it lacks compared to CamScanner and Adobe Scan is the ability to share documents with other services directly. It also puts a watermark on all your default photos if you don't get the Pro version. It does not have different options for specific types of photos like IDs. The software, however, provides password protection for your files, which none of the competitors like CamScanner do. Where can you run this program? You can use it on Android 4.1 and beyond. Is there a better alternative? Yes. If you're looking for free software without restrictions, Adobe Scan is the perfect scanner without a fee. It provides all the necessary items to get the job done. CamScanner has a wider range of features that are only improved in the professional version. Overall, the Tiny Scanner app has a large number of options that will make your scan go smoothly. The password protection feature is just a nice touch to add. Should you download it? Yes, if you don't mind the watermark. Otherwise, you should spring for alternatives like Adobe Scan. Smartphones are useful for many things. One of the less typical examples of use is the digitization of documents. This is very useful for things like scanning forms in PDF format, scanning tax receipts, and even scanning a filled-out form for email. You are undoubtedly here because you fit into one of these usage cases. Don't worry, because we can help. Here are the best document scanner apps for Android! ScannerTurboScan PDF ScannerAdobe ScanPrice: FreeAdobe Scan is one of the new application scanner documents. It ticks all the important boxes, however. You can scan in documents and receipts, like most. It also includes colored presets to make the document more legible if necessary. You can access scanned documents on your device as needed. You can send them by email or back them up to the cloud if you want. Transforming documents into PDFs is another that should be useful. The list of features is not long, but it has important things. CamScannerPrice: Free/\$4.99 per month/\$49.99 per year CamScanner is one of the most popular document scanner applications. It also has a laundry list of features. You can scan the apps in. Jpeg. You can print with a cloud print or even a fax of documents for a nominal fee. It also has cloud support or cloud support drive, Dropbox or Box. There are even functions of cooperation. You can get most of the basic features for free. Another option is to subscribe to the service for \$4.99. This should unlock all the features for those who really need it. Clear ScanPrice: Free/\$2.49Clear Scanner is an easy option for scanner document applications. It boasts fast processing speeds as well as cloud support for Google Drive, OneDrive and Dropbox. There are options for PDF and JPEG conversions. This adds a bit of variety to the proceedings. Some other features include small app size, organization features, editing options, and more. We also like the fast processing speed, the above-average scanning quality and its simple editing features. You can get most of the app for free or pay \$2.49 for the pro version. Document ScannerPrice: Free/up to \$10.99Document Scanner bills itself as an all-in-one scanning solution. It has most basic features such as PDF conversion, scanning, OCR support and others. However, it also includes a code scanner and image support. So you can use this to scan virtually anything. It even has the function to turn on the flashlight in low light conditions. This is definitely one of the most powerful document scanner applications. Here's how it works. However, this is a great option for those who have to kill a few birds with one stone. Fast ScannerPrice: Free /\$2.99Best scanner solid scanner app. You'll find most of the typical features. This includes PDF and JPEG support, document scanning and some editing features. It also supports cloud printing. The developer also has a faxing app that works in case you need fax documents. The free version seems to limit the number of documents you can scan. The pro version removes this restriction. It's also free to use on Google Play Pass if you use it. Genius ScanPrice: Free/\$7.99/\$2.99 per month/\$29.99 per yearGenius scan is another of the most popular document scanner applications out there. It supports key functions for document scanning, conversion, and sharing. It also boasts features to improve scanning of things such as school notes, boards and other subjects. The user interface is simple enough and we enjoyed the quality of the scanning and editing tools. Like Fast Scanner, these developers also have a separate faxing app if you need this along with some additional apps that add even more. The pro version goes for \$7.99 and gets you most features. There is also a subscription service, but we recommend it only to those who use this app religiously. Microsoft Office LensPrice: FreeOffice Lens is a document scanner application from Microsoft. It promotes itself as equally good for school or business use. He scans the documents as usual. Teh Teh it also boasts good quality for things like receipts, boards, sketches, business cards, notes and more. You can save the scan in Microsoft OneNote for a quick link later. The app also works on simplified Chinese, English, Spanish and German. Free to download and use whether you have an Office 365 subscription. However, it works best with a Microsoft Office subscription if it matters. ScanbotPrice: Free with in-app purchases / \$24.99 per yearScanbot is a functional and relatively competent document scanner. It's very similar to CamScanner. It allows you to scan documents, send them anywhere, store them in the cloud, or even fax them if necessary. It also comes with code scanning, barcode scanning and OCR support. It's a bit of a buggy and OCR can use some improvements. This is definitely not the first one we would recommend. However, like CamScanner, it competently covers quite different uses where the benefits outweigh the disadvantages. It's good for what he does. Most in-app purchases are designed to be used in credits when faxing documents. Most features are free. Tiny ScannerPrice: Free/\$4.99Tiny Scanner is one of the best scanner document applications. You'll find support for most of the standard features. Like most, documents save in PDF files for future use. The app also has five levels of contrast, quick search and support for most of the major cloud storage services. Developers also have a fax machine. You can use it to fax documents after they are made. It shares many of the same functions as simple scanning. TurboScanPrice: Free /\$4.99TurboScan is a discreet option for document scanner applications. It has all the basic functions. In addition, it comes with a forward-looking correction and page edge detection for more accurate scanning. It boasts a quick processing time and you can save documents in PDF, JPEG or PNG. It also has multi-page support if you need it. The free version limits you to a three-page multi-page scan. However, the paid version removes all restrictions. If we missed any great document scanner apps for Android, tell us about them in the comments! You can also click here to check out our latest apps and game lists! We recently saw AVG, an Android security app labeling other apps as malware when they are not. This is called a false positive, and it's quite common. When this happens to a popular app, it always causes confusion and all unnecessarily stressed. This time it also made us wonder - do people really need to run any type of Android malware scanner, and they do more harm than good? Android malware certainly exists. We take the question with how it gets reported sometimes, how sensationalism draws attention from real problems, but we're not stupid enough to pretend that people don't write apps designed for causes But who should worry about this kind of thing, and how to stay safe is something that needs to be discussed. This is something we are going to try and do today, in real conversations that everyone can understand. Hit the break and let's get started. When you read the app description to see what it should do, that's all it has to do. If an app does something different or something unverified, we call it malware. It's a pretty broad brush, and often people don't bother to read just what the app can only do to cry foul later. We understand that the list of permissions is often difficult to understand, and Google is trying to make them a little clearer, but they exist for a reason. Whether we read them and click OK, or just skip past them, we gave the app permission to do all of these. When an app tries to access something that you haven't allowed it to do, it's malware. No code is free for bugs, and people are able to write other apps that use these bugs. What is not malware? Apps that do things like rewrite or change system settings or preferences because that's their purpose are not malware. Apps that put spam notifications for garbage you don't want in your bar notification system are not malware if you OK'd ads. Apps that track your location, or read contact information, or intercept browser data after being approved, are not malware. Basically, an application that does what says what it's going to do, or only does what you've given it permission to do, are not malware. These may be dirty apps designed to trick or track you to gather information, but they are not malware. Why does it matter? Frankly, I don't care what people think of an app that puts unwanted ads in my notification bar, or tracks what I'm looking for to add value to their ad network. I won't lose any sleep if everyone thinks these apps are bad and tells all my friends not to install them. Hopefully get developers thinking about new monetization methods that don't put links in my bar notifications or tell some company that I'm buying my underwear on target. On the other hand, some applications are pretty smart and can change the way our devices work by design. I won't name names because I want to remain impartial, but I bet most of us have a favorite app that does something like change our sound settings, or add in some quick switches, or has some other behaviors that affect the system. who use their Android skills and knowledge to create these types of apps are awesome. But as explained above, none of these cases are necessarily malware. When an Android security app hits one with a false positive, they don't do anyone a favor. They're confusing things. I think most of us have seen false positives in Windows Windows some software we downloaded. Keygens, cracks, or dll files included in the torrent are often hit like malware because they demonstrate behavior that looks suspicious. When we tell our Windows virus scanner to ignore them, we always change our minds and hope we did the right thing. The same goes for Android. We know Google Play Movies and TV is not malware, even if AVG tell us that it is. But how about the cool app you've seen a friend use, from a developer you've never heard of? How do we decide when to trust a malware scanner and when not, especially when they have been proven wrong several times? We can't. We roll the dice and go with our intestines, making the app unnecessary. Who needs a malware scanner and who doesn't have time for this real conversation kind of talk. If you want to visit places where you can pirate paid apps, you need a malware scanner. Nothing in life is free, so you get to spend time learning all the false positives or unpacking apps to see what's inside, rather than spending \$0.99 on the app. Don't trust the person who uploaded it when he says it's virus-free and scan every app you download. You get hit with malware after all, as people writing this faster than any Android security companies when it comes to updates, and you end up installing malware that the scanners haven't learned yet. I still can't put up with stealing a dollar from a developer, and think you should actually pay for your apps, but if you're going to steal at least make it safe. If you only download apps from Google Play or Amazon, you don't need to use a malware scanner. Amazon checks every app before they accept it, and Google uses a bouncer to actively scan hundreds of thousands of apps in the Play store. From any store, apps will only be able to do what you've given them permission to do. When apps are new in Google Play, they may not have been scanned yet. Wait a few days or read the reviews if you just have to get it right now. This will keep you safe and you won't need a third party app that can confuse you in the end. It's also worth noting that Google is ramping things up here, and with Android 4.2 delivered on the device the scanner. The first time you go to a sideload app you will see it in action and it scans every app you sideload after that if you told it. If your phone is running 4.2, you have an extra layer of protection without fuss. Conclusion We don't want to try to tell you what to do with your device if you want to use any of the popular malware scanners, by all means do so. But never count on them to be right, and be careful if you sideload apps. You can even use one for other features such as tracking devices or remote wipes, some of them very well. But always remember - the false positive is a problem with your virus scanner, not not it's scanned. Reserve bad reviews for the right people.
