Picture: Brendan Hesse This is not a stretch to assume that you are probably using Gmail—it seems that most of the world does these days. This reality has caused consternation over some recent changes in privacy and security in Gmail and Google Chrome. This is not a sudden turnaround. For years, Gmail and Chrome have been changing from what was once some of the most flexible and open internet tools out there, to something more closed-off-and, in some cases, less secure. These privacy concerns are part of an era of data security risks that go deeper than just Google, and for some it's a matter of privacy from various government agencies. However, creepy and about how the government has access to our data can be, most people are not on the NSA radar. And if so, it won't matter what email service you're using. On the other hand, the real threats to most people's privacy are businesses and private entities that want to buy, sell, and mine your data. Let's throw out a random example: say, maybe Google data mining your inbox so it can better advertise to you, for example? We don't blame you if you want to stop, so let's take a look at the best Gmail alternatives currently available. Is Gmail really that bad? To be fair, while this post is by nature anti-Google (if we're trying to exchange our own email service for something else), there's still a lot of credit for using Gmail and other Google services – this post was actually largely drafted into Google Docs. The point here is not necessarily to spell doom and gloom about Google or its privacy practices, but rather to give viable alternatives that can address a number of shortcomings Gmail has overall. The following sections provide paid and free alternatives that cover everything from enhanced security features to deep personalization tools for private users and businesses. G/O Media can earn a commission MySmile Teeth Whitening Kit The real privacy threats of most people are businesses and private entities that want to buy, sell and mine your data. Paid alternatives For what to pay for an alternative to something that is free? Well, because these email services do so much, if not more, like Gmail, but without ad support and with stronger privacy protection. Additionally, you won't spend more than an average of \$5 or \$6 per month through most of these services. If you're after an upgraded email solution, sacrificing a cup of coffee every month is probably worth it. Quick notification that applies to most services here: If the email client you're interested in doesn't track your data, it won't save your password. Be sure to keep that written down somewhere safe, and if necessary, set up accounts for redundancy just in case. Kolab Now Screenshot: Kolab Now This Swiss company has perhaps the most attractive and an alternative to Gmail that is currently available (and Microsoft Office Suite). Users get access not only to the email service, but to the entire package of ad-free online apps, such as calendars, file editors, and more that can sync with all your devices and access collaboration as in Google Docs. Any privacy concerns you had with Gmail are questionable with Kolab Now. Not only does Kolab now ensure that your data and files are safe from the prying eyes of businesses, but email servers are also located in Switzerland, a country with incredibly strict privacy laws. The service stores debugging report logs only when needed — otherwise it's completely hands-off. Moreover, the whole thing was built on open-source software. There are two packages, an individual plan (about \$4.56 per month based on currency conversion) that includes all of the above features, and a group plan (about \$5.56 per user per month) that adds custom domain support, management tools, and support for up to 100 users in one plan. You can also test one of the options with a 30-day free trial. Proton Mail Proton Mail is another Swiss company, but it focuses exclusively on secure email rather than the software suite that Kolab Now provides. Users can register completely anonymously, all emails are fully encrypted from start to finish, and the service does not track any IP address information — and because it is hosted in Switzerland, your email server is inaccessible. In addition to the web client, Proton Mail for Android apps are also available on iOS, and all are built from open source programs and have the same security and encryption. Users can sign up for a free account that provides up to 500 MB of storage per user, but saves a daily limit of 150 messages and reduced technical support. However, paid options are much more appealing: Plus: \$5 per month, or \$48 per year. Includes single-user support, 5 addresses, 5GB of storage, up to 1,000 messages per day, email filters and autosend features, and better technical support. Professional: \$8 per month, or \$75 per year. It supports up to 5000 users, 5 addresses per user, 5 GB of storage per user, unlimited messages and folders, and priority technical support. Visionary: \$30 per month or \$288 per year. It only supports a maximum of 6 users, 50 addresses and a total of 20GB of storage, but adds ProtonVPN access and all professional-level features. You can also opt for additional storage, addresses, and domains at additional monthly prices. FastMail Screenshot: Fast Mail FastMail is a very popular email service, and you'll probably see the first name listed if you're looking for a serious paid alternative to Gmail. The service provides full mobile synchronization for push notifications and contacts and live technical support in these subscription packages, which are priced as follows: \$3 per month or \$30 per year, per year, userStandard: \$5 per month or \$50 per year, per professional user: \$9 per month or \$90 per year per user. A 30-day trial exists, but only for standard and only covers a maximum of five users. The Basic package gives you 2GB of storage per user, while Standard and Professional offer 25GB and 100GB. Professional subscribers also get unlimited space to archive and store data. One thing to keep in mind is that subscribers at the \$5 and \$9 level can use their own domain addresses, while users of \$3 can only use Freemail addresses. The company @freemail address information if it's no longer in use — so if you cancel your free mail account, it's possible someone else might end up with it. While this is unlikely, it poses potential privacy concerns, so if you can use a custom domain, we recommend doing so. No matter which package you choose, Fast Mail does not track any of your data or use ads. Tutanota If we kill some of the options here include business options, and in some cases are tailored specifically for them, Tutanota is primarily for individuals or smaller groups, and its prices reflect this. Users start by creating a free account that includes 1GB of mailbox storage and a Tutanota domain address. From there, you can upgrade your account to either Premium accounts (about \$1.20 to \$1.40 per month) or Pro (about \$5.88 to \$7.06 per month) accounts, plus the ability to customize your subscription further with expandable storage and other email aliases. In addition to price flexibility, safety is the main attraction. Like Proton Mail, Tutanota provides end-to-end encryption of your emails. It hosts your emails in Germany, which benefit from stricter EU data laws than we have in the U.S. Zoho Mail Screenshot: Zoho Mail Zoho mail is primarily built on business needs rather than individuals (although free email-only accounts are available to individuals). As such, the \$3 month Standard Zoho Workplace package includes multi-account access to Zoho Office Suite for all subscribers, providing editing applications for documents, spreadsheets and presentations, password-protected sharing, cloud drive storage, and the Zoho Cliq live messaging app. The \$8 per month level sweetens the deal with three other apps: Zoho Meeting for video conferencing, Zoho Connect for task management (like Trello or Asana) and remote Meeting software Zoho ShowTime. There are also free email accounts that support up to five users who limit users to a single domain address, a limit of 25 MB per attachment size, 5 GB of storage per user, and can only be accessed through a web client. Microsoft Exchange Online Yeah, we know - exchange from Gmail to Microsoft is not such a big change, but in terms of software packages, data and analysis and overall performance, Microsoft Server is a definitive competitor. Competitor: Be shelling out \$12.50 a month per user, but you'll have the entire Microsoft Office and Services Suite in addition to email services. Enterprise-only email options are also available—a \$4 monthly subscription provides 50GB of mailbox storage per user, while paying \$8 per month gives you 100GB per user. Free alternatives When it comes to free email options, few of them can match Gmail in terms of feature width, flexibility and ubiquity. However, instead of jumping ship to something like Yahoo, we recommend looking into free packages available from some of the above companies, specifically Tutanota, Proton Mail and Zoho Mail. The only other free option we recommend is iCloud. Apple has a much more user-friendly privacy policy when it comes to data collection. It's also available on virtually every iOS and Apple device, and provides most of the same features as other Google Drive services. If you want to go all-out and swap platforms altogether, going from Google Drive to iCloud is not a bad idea. It won't give you the same level of flexibility or privacy as some of those luxury Swiss options, but it's still a viable alternative. Screenshot: Apple Oterically what's left are the other guys from the email world: AOL, Yahoo, Outlook, AOL, Mail.com, GMX, Yandex, etc. These options are supported by advertising, hosted in the U.S., Russia, or other countries with softer privacy laws, and most of them are owned by larger companies with their own potentially sketchy tracking practices. So yes, AOL, Outlook, and Yahoo may be technically viable free alternatives to Gmail in the most basic sense of the word, but it would be false to say that they don't come with yahoo's own major red flags, for example, they seem to have rocky records when it comes to keeping their users' data safe from hackers. Still, if you're through Gmail and just want something new, they'll get it for free. Hosting your own email server There is one last option to consider, and this is hosting your own email server. If you are considering this option, you are a brave soul. Hosting an e-mail server can be a complex and challenging project that requires at least intermediate familiarity with the Linux operating system (specifically Ubuntu), server software, and computer hardware. There is one service called Mail-in-a-Box that aims to facilitate the process of much simpler setup and mitigation of some hardware requirements that entails the operation of your own e-mail server. Screenshot: Mail-in-a-Box How despite the mail-in-a-box streamlining a lot of the process, the whole project still takes several hours, and this does not include the time it takes to create the server computer itself. In addition, if you decide to try Mail-in-a-box, make a note of your goals as stated by the creators on the official page: Make deploying a good mail server server decentralisation, innovation and privacy on the web. Have an automated, auditable, and idempotent system configuration. Don't make a completely unhackable, NSA-proof server (but see our security procedures). Don't change something that powerful users can customize. The last two are important, especially if they conflict with your ultimate goal of running a private email server. Technically, there are methods for creating an email server that is close to digital Fort Knox, but only seriously qualified users should try something like this. In fact, if you came here to look specifically for tips on setting up your own private email server, it's best to let this professional. Professionals.
