Google's sophisticated and convenient remote desktop comes with easy installation and even easier access. Its best feature is that it's free! Secure access to another user's computer from anywhere, at any time. It's seamless, fast and free. View multiple desktops from the same location with Chrome Remote Desktop. This useful software allows you to set up any desktop as a host and securely connect to it from other devices. Collaborate with colleagues and work on the project in real time. The host can move effectively from screen to screen and seamlessly use someone else's device as if it were their own. You don't need a host to be online or log in. Finish the team project without bothering the other members. Just use the host computer to access your desktop and access the files you need. Communication is usually a problem with this kind of program; However, Google has managed to figure out how to do this without problems. Take advantage of a smooth connection and fast download between computers. Eliminate factors such as slow internet speed and focus on important things. This software has somewhat failed due to the lack of a built-in file option. You need to use a third-party file-sharing app between computers, which can be frustrating. Another pitfall is that there is no in-house chat. This is an important feature because it allows you to communicate better between colleagues and make better use of the program. The Chrome web browser and Google account are required to use this software, but both are free and should not be inconvenient. Where can you run this program? This app is available on devices using Windows 7 or more of the latest operating system. Is there a better alternative? No. This software is free and reliable. It works like an extension on the Chrome browser, meaning it won't take up much space. If you need a larger and secure version of this tool, try AnyDesk.Chrome Remote Desktop is a healthy and useful program for group projects. This allows seamless integration between computers, regardless of location. However, it can be improved by adding chat features and file sharing options. Should you download it? Yes. It's a great tool that offers the ability to share your screen with multiple users while avoiding the problems usually associated with this kind of program. iOS: Google has just released an iOS app for its Remote Chrome desktop app. With the app installed on your iOS device and the Google Chrome extension, you can log in and Your home computer remotely. Once you've installed the extension and the app, you can log on to your computer from your iOS device in seconds using your Google account. In a bit of brief testing, it works about as well as other remote desktop options, with the added benefit of being free. Chrome Remote Desktop (free) iTunes iTunes Shop Once upon a time, in the world is not so far away, access to the computer remotely requires all sorts of expensive, complex programs and technical know-how. These days, it's a different story. Google's free Chrome Remote Desktop service makes it dead-simple to get on any computer - Windows, Mac, Linux, or Chrome OS - from almost any other desktop or mobile device. You can access all the contents of the remote system and even click around as if you were sitting right in front of it. Chrome Remote Desktop can be useful for entering your personal or work computer from afar, and it can be just as valuable for peering into someone else's system - whether it's your colleague or your mother - to provide practical help without having to be in the same place. And best of all? Getting the service up and running is as easy as it can be. In fact, all you have to do is decide what type of connection you want and then complete a couple of quick steps and you'll remotely connect like no one's business. (Please note that Chrome Remote Desktop may not work with company-managed Google accounts at the corporate level. Using Chrome Remote Desktop to access your own computerStep 1: Prepare your computer for connectionsIf you want to have access to your own computer from another desktop or mobile device, start by opening Chrome on a host computer (or downloading and installing Chrome if you're using a Windows, Mac or Linux system that somehow still doesn't have it). In Chrome, go to Google's Chrome Remote Desktop app and click on the circular blue arrow icon inside the box with a remote access setting tag. (If you see a blue button that says Turn on instead of a blue arrow, congratulations: You're one step ahead! You will then be asked to download the Chrome Remote Desktop extension. Click on the blue Add to Chrome button on the page that appears and confirm that you want to continue. Then go back to the original tab and you'll find a hint waiting for you to call your computer and move forward. JR Raphael/IDG You can give your computer any name you want, as long as you learn it. (Click any image in this story to enlarge it.) Once you've given your computer a name and pressed the next button, you'll be asked to create a PIN for at least six digits. For security purposes, you'll need that PIN - in addition to logging into your Google account - in order to access your computer remotely. (Google says all remote desktop sessions are also encrypted for additional protection.) And that's just about it: Your operating system can pop up Making sure you want the app to access to initiate a remote connection (and some versions of macOS may additionally require you to provide a couple of permissions on Chrome Remote in system preferences), but once you've confirmed this, the Chrome Remote Desktop tab will show you that your computer is online and waiting. The computer will remain available anytime it's turned on and Chrome running (and since Chrome usually starts automatically and runs in the background, that means it's likely to be available anytime the computer wakes up - period). Just note that if you want connections to remain possible for a long period of time, you may need to visit your computer's power management settings to make sure the system doesn't go into hibernation (even if the display shuts down). If you ever want to disable a remote connection, just go back to remotedesktop.google.com/access or tap the Chrome Remote Desktop icon to the right of the browser address strip. You can then click the trash can icon next to your computer's name to remove it from the app. Alternatively, you can simply delete the app altogether by clicking on its icon and selecting Delete from Chrome. Step 2: Connect to your computer from another desktop or mobile device Already the easy part: With your host computer all set to connect, all you have to do to access it from another desktop computer is to go to the same remote desktop website - remotedesktop.google.com/access - in the Chrome browser. You must be subscribed to Chrome using the same Google account you used in the host system, but you don't need any specific apps or extensions installed; You'll just see your computer's name appear and you can click on it to start connecting. After clicking in the PIN, you'll be in - and you can navigate across the screen, tap and run whatever you want, and usually just use your computer as if you were sitting in front of it. The side-of-screen bar will provide options for setting up the display and sending complex commands such as Ctrl-Alt-Del. It will also allow you to synchronize the clipboard between your current computer and your host computer if you are so inclined, so you can copy and paste text seamlessly between them. Jr Raphael/IDG Desktop host computer is fully available in the browser tab, with a folding panel for advanced commands. For mobile access, you'll want to download the Chrome Remote Desktop app for iOS or Android. Provided your phone is subscribed to the same Google account you used on your computer, the app will automatically show your computer and allow you to connect to it with the same quick click and PIN input. Then you will be able to mouse around on your desktop using your fingers. You can scroll, sliding in any direction or zoom in by pinching. In the Android app, swiping down from the top Will show a control panel that will allow you to switch to trackpad mode - in which you can on the left click by clicking with one finger or right click by clicking with two two and switch to keyboard mode to pull up the device's on-screen keyboard and type text. In iOS, click the menu button in the bottom right corner of the screen to access the same options. JR Raphael / IDG Whole desktop, on hand - on your phone. It's not the most elegant way to get around a computer - and you probably wouldn't want to use it for any intense work - but it can be handy for quick-hitting tasks such as restarting a system from afar or capturing a file you forgot to save in the cloud. Using Chrome Remote Desktop to access someone else's computerStep 1: Preparing your computer to connectIf if seeing someone else's screen is what you're after, the process of setting up Chrome remote desktop is a little different. And since you presumably won't be physically present on the receiving computer, you will need to provide these instructions to the person who will be there and able to complete this part of the installation. On your computer, you want to access remotely, start with Google's Remote Desktop Support section. Tap the circular blue arrow in the box marked Get Support, and then click add to Chrome in the box that appears and confirm that you want to install Chrome Remote Desktop Extension. (If you don't see the blue arrow, the extension is already set - and you're one step ahead. JR Raphael/IDG Setting for a remote support session is slightly different, but the end result is the same. Go back to the original tab and you'll find a hint that tells you to press the Generate Code button to give access to someone else. When you do, the site will create a one-time access code that will remain valid for just five minutes. Share this code with the person you want to give access to - by phone, email or text message, or what works best - and then sit back and wait for their connection to start. Step 2: Connect to your computer from another desktop, as you have an access code and are ready to connect, just go to remotedesktop.google.com/support in Chrome on any other computer. Enter the access code in the Give Support box and then click the Connect button to start. (If you want to connect from a mobile device, you'll need to open a new Tab in Chrome on your phone, check the window in the browser's main menu to request a desktop version of the site, and then go to the same link from there. The person at the other end will have to manually press a button to approve the connection (and macOS users, will also have to provide permissions in system preferences) and then you will be connected to their computer and able to click around control it in the same way described in the first part of this guide. Google still has its original version of the Chrome Remote Desktop app published and available in the Chrome Web Store, by the way, but this version is currently officially deprecated and is no longer actively supported or supported. So if you had that on your system from previous use, now is the time to remove it and move on to this new setup instead. It's not even remotely difficult- isn't it?
