Genetic sensory hearing loss. In: Flint PW, Francis HW, Haughey BH, et al, eds. Cummings Otolaryngology: Head and Neck Surgery. 7th o.p. Philadelphia, Pennsylvania: Elsevier; 2021:chap 150.Page 2 The following tests can be done: TREATMENT Solution problem, if found, can lead to the disappearance of symptoms. (For example, your isp may remove wax from the ear). If an ATM is the cause, your dentist may offer dental devices or exercises at home to treat teeth grinding or tightening. Talk to your doctor about all the medications you are currently taking to see if the drug may be causing the problem. This may include non-reevotic drugs, vitamins and supplements. Do not stop taking medication without first dedicating your doctor. Many medications are used to relieve tinnitus symptoms, but no drug works for everyone. Your ISP may need to try different medications or combinations of medications to determine what works for you. The tinnitus masker is used as the owner as a hearing aid can help some people. This device makes low-level sounds directly into the ear that mask the sound of the ear. In addition, the hearing aid can help reduce auditory noise and amplify external sounds. Counseling can help you learn to live with tinnitus. Your primary care physician may recommend biofeedback training to help with stress. Some people have tried alternative treatments for tinnitus. However, these methods have not been verified, so contact the supplier before trying any of them. Tinnitus can be controlled. Talk to your provider about a management plan that works for you. The American Tinnitus Association provides a good resource center and support group. Page 3Chole RA. Chronic otitis, mastoiditis and petrositis. In: Flint PW, Haughey BH, Lund et al, eds. Page 14HOW CHEMOTHERAPY IS ADMINISTEREDDepending type of cancer and where it is located, chemotherapy drugs can be administered in different ways, including: intramuscular injectionsUpcutaneous injectionSin the arteries in the vein (intravenously or IV) Tablets taken orallyInjects in the fluid surrounding the spinal cord, a thin catheter can be placed in the large This is called the central route. The catheter is placed during a small operation. There are many types of catheter, for example: The central venous catheter Eternal venous catheter with percutaneously inserted central catheter (PICC) Central catheter can remain in the body for a long period of time. It will need to be washed weekly or monthly to prevent blood clots from forming inside the catheter. Various chemotherapy drugs can be given at the same time or one by one. Radiation therapy can be given before, after or during chemotherapy is now received. Chemotherapy is most often given in cycles. These cycles can last 1 day, a few days or several weeks or more. There is usually a rest period during which chemotherapy is not performed between each cycle. The rest period can last for several days, weeks or months. This allows the body and blood to recover before the next dose. Chemotherapy is often given in a special clinic or hospital. Some people can get it home. If chemotherapy is given at home, home nurses will help with medications and intravenous (IV) pathways. The person receiving chemotherapy and their family members will receive special training. DIFFERENT TYPES OF CHEMOTHERAPYThe different types of chemotherapy include: Standard Chemotherapy, which works by eliminating cancer cells and certain normal cells. Targeted treatment and immunotherapy focus on specific targets (molecules) inside or on cancer cells. CHEMOTHERAPY SIDE EFFECTSSED by these drugs traveling through the bloodstream throughout the body, chemotherapy is described as a treatment that covers the entire body. As a result, chemotherapy can damage or destroy some normal cells. These include bone marrow, hair follicles and mucous membranes of the mouth and digestive tract. When this damage occurs, there may be side effects. Some People Who Receive Chemotherapy: They're More Likely Infection Manning is easier Toning too much, Even during daily activitiesSentut pain or numbness from nerve damagePresident dry mouth, mouth ulcers or swelling in the mouth Thousand appetite or lose weightPresident indigestion, vomiting and diarrheaPresident hair lossDo think and remember (chemo brain) Side effects of chemotherapy depend on many factors, including cancer and which drugs are used. Everyone reacts differently to these medications. Some new chemotherapy drugs that better attack cancer cells can cause fewer or different side effects. Your doctor will explain what you can do at home to prevent or treat side effects. These measures include: Be careful with pets and other animals to avoid infecting them with enough calories and protein to maintain your weightPrevent bleeding and what to do if you present yourself and drink safely with your hands often with soap and water you should attend follow-up visits with your provider during and after chemotherapy. Blood tests and imaging, such as X-rays, MRI, CT or PET scans, will be done for: Monitor how well chemotherapy works Be careful in case of damage to the heart, lungs, kidneys, blood and other parts of the body sordera neurosensorial congenita pdf
