In contrast, the second largest browser in the world, Mozilla Firefox, has only 8.21% market share. This data is enough to show the dominance that Google Chrome exerts in your browser's space. That said, despite its dominance, it is not flawless as it has its fair share of problems. The biggest problem with Chrome is that it's too resource-heavy. Second, and what worries me the most is the privacy issues that come with using Google Chrome. Google is a giant in the data collection industry, and like Chrome users, we log all over our web data to Google. If for these reasons or for any reason yours, you want to switch from Google Chrome, you've come to the right place. In this article, I'll share with you the top 10 Google Chrome options you can use to browse the Internet in 2020. Best Google Chrome options you can use (2020) Before we get to our list, we can take a quick look at some of the reasons why you should use a Google Chrome option: Why you need to switch from Google Chrome Google Chrome is too resource-heavy. Despite being just a browser, it uses a lot of your computer's resources. So if you have a budget or an old device, you can do it faster just by switching from Google Chrome. Google is primarily an ad delivery company. By using Google Chrome, you'll hand over data to Google for targeting ads. It is no longer the fastest browser on the market. Google Chrome doesn't offer built-in options to customize your experience. You can use Chrome Flags, but they're not intuitive and can cause problems. There are tracking prevention. Finally, there are tons of better options on the market right now that are fast and privacy-conscious. If these reasons speak to you and you want to remove Google from your life, you should switch from Google Chrome, and the browsers listed below are the ones you should consider weaning yourself from Google Chrome. List of browsers that can replace Google Chrome 1. Mozilla Firefox Quantum There used to be a time when Google Chrome had clear speed advantages over other browsers, and thus it was difficult to recommend any other browser despite its flaws. But that's not the case anymore. With the launch of Firefox Quantum, the beloved Firefox browser has become as fast as Google Chrome, and even turned it into certain calculations. Firefox Quantum has been built from scratch with a new and powerful engine that provides fast performance. This means that users experience faster and better loading times with less data memory consumption. Firefox also resolves one of the biggest issues we encounter while using the Google Chrome browser that is memory usage. Firefox Quantum is very easy on resources, and even after opening a dozen tabs at a time, I do not feel any noticeable system decline. According to Firefox, the new browser uses 30% less memory than Google Chrome, and while I can't confirm that number, I've noticed significant improvements. Firefox also provides improvements to the private browsing experience. Not only does your browser delete all your data after your private browser session is over, but it also blocks web meters that chase you across websites to show you ads. If you're looking for a Chrome option and haven't used Firefox for a while, I encourage you to give it a go. I'm sure you won't go back. Compatibility: Windows, macOS, Linux, Android, iOS Installer: Free 2. Brave Browser Brave Browser is currently my favorite browser and I use it for all my needs. The browser has a lot of things that go for it. The best thing about Brave Browse is that although it is similar to Google Chrome in features and speed, it focuses heavily on privacy. With Brave Browser, you get the best of both worlds. Speaking about the features first, Brave Browser is a copy of Google Chrome. When you see how it is based on the same Chromium engine that Google Chrome uses, it's no surprise. When you switch from Chrome to Brave, you'll feel at home as it has almost the same navigation structure. Your browser even supports all Chrome extensions, so you don't have to worry. All that is good, but the reason I recommend this browser is privacy. Brave Browser comes with a built-in ad and tracking blocker and HTTPS upgrade. This means it will protect you from ads and tracking pixels and harmful without you need to do anything. Times when you want to surf the internet You can invoke Brave's supercharged incognito mode that uses TOR to hide your IP address. I'm using Brave Browser the last few months and I have to say that it's one of the best Google Chrome options on the market right now. Compatibility: Windows, macOS, Linux, Android, iOS Installer: Free 3. Opera Another great alternative to Google Chrome is the Opera browser that is based on the same Chromium architecture that Google Chrome uses. What this means is that you will find many features here similar to Chrome. It's a good thing that even longtime Chrome users will feel at home here. Apart from bringing features similar to Chrome, Opera brings its own set of features that make this browser very unique. My favorite Opera feature is the built-in unlimited VPN tool. The tool is not only great when it comes to unlocking region-locked content, but it also helps protect your privacy by creating your IP address. Opera also comes with built-in ad blocking, so you can browse the internet without seeing any ads. Another good feature of Opera is Opera Turbo Mode which when enabled compresses all the data. This results in not only faster loading times, but also less use of data that makes it perfect for users with limited Internet data connections. There is also a battery saver mode that allows your browser to use less battery and thus gives you up to 50% more battery life. As you can see, there are many features that can come to very useful and you should certainly consider Opera if you are looking for a Chrome option. Compatibility: Windows, macOS, Linux, Android, iOS Installer: Free 4. Tor Browser If you value your privacy above everything else, Tor Browser is just for you. As I mentioned in the introduction of this article, one of my personal major concerns is using the Chrome Data Collection Policy. With Tor Browser, you do not have to worry about such a problem. In fact, when you use Tor Browser, nothing can track your data and you can browse the internet completely anonymously. Tor Browser achieves this by skipping your communication around a distributed network of relays powered by volunteers around the world. This means that if someone looks at your Internet connection, they won't be able to learn the sites you visit. Not only that, your browser even prevents the websites you visit from learning your physical location, and allows you to access websites that are blocked where you are. Tor is also the browser that allows you to access the Deep Web, but it's not something I recommend you do if you don't have any knowledge of it. You can get a primer on both the Deep Web and the Dark Web by clicking on the links. That said, try to access them at your own risk. The point here is that for anonymous browsing, there is no better browser out there than Tor. Windows, macOS, Linux and and Install: Free 5. Vivaldi While Google Chrome can be customized, customization has limits. If you want a customizable browser to look and behave exactly the way you want, use Vivaldi. Vivaldi has become a popular browser in recent months as it brings lots of customizability features that no other browser offers. Firstly, you can use ultra-customizable themes to give your browser a look that's unique to yours. Not only that, you can even create a schedule to change your browser's theme during the day. The browser also comes with an editable sidebar so users can add a website that they deem appropriate. Whether it's your favorite chat apps, social feeds, or news sites, you can add as many sites as you want. You can even rearrange these sites' location using easy drag-and-drop tools. One of my favorite features in Vivaldi is the adaptive interface. Basically, the browser picks up the main color of the site you're viewing and uses it as an accent color. Other features of your browser include the ability to save open tabs as sessions, a built-in fully functional note extension, great keyboard shortcuts and mouse gestures for navigation, and more. The browser also provides additional security for its users as it never tracks or collects user data. Vivaldi is also working on end-to-end encryption of your data while syncing across devices to be released soon. Overall, I like this browser, and if you want a browser that gives you control over how it looks and behaves, you should probably use it. Compatibility: Windows, macOS, Linux Installer: Free 6. Microsoft Edge on Chromium Microsoft Edge on Chromium is Microsoft's latest attempt to create a successful browser. After the Internet Explorer debacle and the lukewarm reception of Microsoft Edge, the company has finally given back to the power of Google Chrome's underlying engine and is now basing the Edge browser in the same way. The new Microsoft Edge runs on the same Chromium engine, which means it's quite similar to Google Chrome in features, speed and appearance. Currently Microsoft Edge on Chromium in beta and is meant to get a full release before the end of this year. I've been testing the browser for a few weeks now and other than a few bugs here and there, it's been pretty stable for me. The best thing about this browser is that unlike Google Chrome, it doesn't tax your computer's resources much. Also, since it supports the entire Google Chrome Extensions library, I had no problem switching to it from Google Chrome. Of course, Microsoft has also baked into features like cross-platform synchronization using Microsoft account, Microsoft News and more. The new Microsoft Edge is a similar browser to Google Chrome. I just hope that this by Edge is not as tracking friendly as the latter. Compatibility: Windows and macOS macOS apps coming soon) Install: Free 7. Torch Browser If you are someone who downloads a ton of media from the Internet and always looks up for software that can help you do that, how about trying a browser that can help you download everything you want without the need for a third-party software? Well, that's what Torch Browser does, and it's pretty good at it. The browser comes with a built-in media grab that gives you a download button next to videos hosted on a website, so you can easily download media for offline consumption. One of the best things about the Torch browser is that it comes with a built-in media player that lets you play videos that aren't fully downloaded. Torch Browser also brings built-in support for torrents so users can download torrent files without needing third-party software. The browser also comes with a music extension that allows users to listen to their favorite music without paying anything. Finally, there is a game extension that allows users to play browser-driven games for free. Torch Browser is the best browser for entertainment and a worthy alternative to Google Chrome for media lovers out there. Compatibility: Windows, macOS Installer: Free 8. Safari If you're using an iOS or macOS device, Safari is the best Google Chrome option you can use. Not only the browser is fast, but it is also quite secure. Over the past couple of years, Apple has primarily worked with users' privacy features, and it has made Safari a heaven for privacy-concerned users. First of all, Safari automatically blocks ad meters from following you along websites, thereby hindering their efforts to access your browser pattern. That means that when you search for shoes on Amazon, you won't see ads for shoes over the next couple of days. Safari also blocks videos from autoplay on websites. I hate sites that keep automatically playing videos on their website as it takes away control from users. With Safari, I don't have to worry about it anymore. One of my favorite features in Safari is the read mode that when enabled removes all the distractions and allows me to read articles in a clean user interface. If you want, you can even save articles for offline reading. This feature feels especially useful on iPhone, as I don't have to waste my mobile data to read articles. Safari is very fast, has a clean user interface and syncs astonishingly well across devices that make this one of the best Chrome options you can get. Compatibility: iOS, macOS Installer: Supplied preinstalled 9. Epic Privacy Browser Epic Privacy Browser is yet another Google Chrome option that focuses on the privacy of users. The browser includes built-in protection against thousands of tracking scripts, and other tracking agents, ad networks, cryptocurrency extraction scripts, dangerous misverting, misverting, third-party widgets. According to their website, on average, the browser blocks more than 600 trackers in a single browsing session. This number alone should make you fear a browser like Chrome that doesn't come with any ad track blocking features. One of the biggest features of Epic is the one-click encryption tool that when activated hides your IP address and encrypts your browsing. The best part is that even DNS requests are routed through the encrypted proxy. This protects your browsing history from your Internet service provider, employer, government, data collector, and other network snoops. If you want to save yourself from all the annoying trackers that track you across websites and collect data on you, Epic Privacy Browser is just the right thing for you. Compatibility: Windows, macOS Installer: Free 10. Chromium Chromium is an open source browser project that aims to build a safer, faster and more stable way for all users to experience the web. If you've never heard of it before, you'll be surprised to know that most of your favorite browsers run on Chromium, including Google Chrome and Opera. What distinguishes Chromium from browsers like Google Chrome and Opera is the fact that it is an open source project, so anyone can potentially review the code. Chromium is also going to the browser for many of the Linux distributions as they only support open source projects. The Chrome browser is also more private than Chrome, as it doesn't collect user data. That said, if you use the extension store, you will give some kind of information to the extensions developers. Chrome is the best open-source Google Chrome option and you should try it out. Compatibility: Windows, macOS, Linux, Android Installer: Free Bonus: Slimjet Slimjet is a Chrome option for users who are tired of seeing many ads when browsing the internet. Your browser automatically blocks all ad tracking ads and scripts that chase you across websites. The browser is based on the same Chromium project that Chrome uses, but it doesn't send your data back to Google. Slimjet is also armed with the most advanced anti-tracking technology to prevent various attempts to invade your privacy. The browser also provides protection against phishing and malware, advanced privacy control options, robust sandbox and multi-process architecture. There is also a built-in speed download manager that can download multiple files in parallel without affecting the overall internet speed. If none of the browsers above meet your needs, you should check Slimjet out. Compatibility: Windows, macOS, Linux Installer: Free experience quickly and securely internet with Google Chrome options That ends our list of the best Chrome options you can use. have tried to include browsers that will meet the needs of most users. Check these browsers out and let's which are your favorite Chrome options among them all. Also, if you are already using another browser that is not on the list but should be here, share the name in the comments section below. Below.
