of them, install a root backup app, make a backup, and then share the backup with all of them. But if all you have to do is install the app on each device (without cloned data), just use the .apk extractor, download the file to the cloud storage (Dropbox, Drive, website, whatever). You'll have to turn on THE USB debugging on each device and allow installation from other sources, but at least you don't have to root 200 devices. What exactly are you trying to do? If we knew more, we could help you better. And maybe save you from the trouble of doing something 200 times on your own, rather than 200 people doing one thing. August 20, 2014, 04:31 #3 quote: Originally published as Planterz Cloning possible. You will need to root out and install custom restores on each one, make nandroid backup of the original, and make a recovery on the rest. If all you have to do is clone the app and data, eradicate all of them, install a root backup app, make a backup, and then share the backup with all of them. But if all you have to do is install the app on each device (without cloned data), just use the .apk extractor, download the file to the cloud storage (Dropbox, Drive, website, whatever). Hello there, Thanks for the quick response. To answer your question: 1. We have an app that needs to be installed on 200 devices by one person. 2. We need all Nexus devices to run at 4.4.4, rooted. 3. After the initial configuration of each Nexus, we will need our app to be 4. Once the devices have our app installed, we have to customize our app, one device at a time (specific settings on each device) Our counter part, IOS, allows us to use Apple Configurator to massively upgrade, install and rename devices on the fly. We basically have to find the android equivalent. Page 22 Just installed this ROM and everything works I would like a Danish keyboard for HTC Sense, I see there are polish, but do not know if it takes much to make a Danish file. I can't post in a stream on ROM because I'm new to the site. Page 23 Hello! I tried flashing the custom .zip and it's unidentified without giving errors. After that, I tried rebooting my phone, but it won't reboot - it's stuck on the bootlogo screen. I can't get the phone into recovery/any other mode with any combination of keys. Did I just brick my phone? Android: Paranoid Android 4.4.42 Phone Model: Galaxy S3 i9300 I attached .zip I installed. META-INF (meta-inf paranoid android) com (daddy) org (daddy) CERT. RSA CERT. SF MAYFEST. MF system (daddy) - app - stik.apk - - - stik.odex Basically, I tried flash SIM toolkit for my paranoid android. Attached flash.zip - Click on R Code (322.4 KB, 2 views) August 20, 2014, 04:35 PM (quote by #2: originally published by keervevustauk Hello! Hi, it can't really be a brick. I would try to load into download mode and flash stock firmware through one. It always works! Page 24 Hello everyone, after a long I've been following xda developers, so I can use better some of my devices, and for that, thank you, another thing, my Galaxy Y GT5360, I made a root and I install some rom, this phone throw new, in less than 90 days, ...problem is that with rom that I install, I can not get Wi-Fi, it is scanning right, but when trying to connect it says disconnected, ... if someone to say to me that do????? I know I made a mistake when I didn't back up the original system, but I think it's possible to quit smoking perhaps, the only thing I don't now very well this phone, help will be great, world. Page 25 I have a phone (LGL34C) that has a really inaccurate location, and I do a few things that require (Ingress/ Mapping Networks). To that end I did some research and came upon the now defunct app called Mocked (can't post links, but googling for Android GPSD The customer will get links to AppBrain and App'oom that have information about it) that has been removed from the playback store and whose site is gone. Left. The app is connected to a remote GPSD server and used as a location provider. This would be ideal for many applications where a more accurate GPS fix could be obtained using a laptop with a USB GPS receiver and a GPSd server. Otherwise, if not where should I start looking, how to reproduce its functionality? Page 26 Is there a forum for Samsung Galaxy Winning Phone? if there is no ROM designed for this phone?
