To get the Java development environment set up on your machine – you are developing (write) computer programs using a development environment - you will need to complete the following steps: Download a large file that contains the Java development environment (compiler and other tools). Download the large file that contains the Java documentation. If you don't already have WinZip (or equivalent) on your machine, you'll need to download a large file that contains WinZip and install it. Install java development environment. Install the documentation. Customize several environment variables. Test everything. Before you start, this will make things easier if you create a new directory in your temp directory to hold the files that we will download. We'll call this the download directory. Ad step 1 - Download java development environment Go to page . Download the SDK software by clicking on the Download J2SE SDK link. You'll see a licensing agreement. Click Accept. Select your operating system and download the file to your download directory. It's a huge file, and it will take several hours to download over a normal phone line modem. The following two files are also large. Step 2 – Download java documentation Download documentation by selecting the operating system and clicking on the documentation link SDK 1.4.1. Step 3 – Download and install WinZip If you don't have a version of WinZip or equivalent on your machine, go to the page and download a copy of the winzipa to evaluate. You can start EXE you can install it. We'll use it in a moment to install the documentation. Step 4 - Install the Pokkini j2sdk-1_4_1-*.exe file that you downloaded in step 1. It will unpack and automatically install the development kit. Step 5 - Install documentation Read the installation instructions for documentation. They will instruct you to move the documentation file to the same directory as the one that contains the development kit you just installed. Undo the documentation and it will fall in the right place. Step 6 – Customize the environment according to the instructions on this page, you need to change your time fickle. This is easiest to do by opening the MS-DOS prompt and typing PATH to see what the path is currently set. Then open autoexec.bat in Notepad and make changes to the PATH listed in the instructions. Step 7 – Test Now you should be able to open another MS-DOS window and type in the javac. If everything is set correctly, then you should see a two-line of text coming out that tells you how to use the egg. That means you're ready. If you see a Bad Command or File Name message, it means you're not ready to go. Understand what you've done wrong by re-editing the installation instructions. Make sure PATH is set up correctly and works. back and again interpretively program Creed up and be persistent until the problem is resolved. Now you are a proud owner of a machine that can assemble Java programs. Ready to start writing the software! By the way, one of the things you just unpacked is a demo directory full of neat examples. All the examples are ready to run, so you might want to find the directory and play with some of the samples. Many of them are waving sounds, so be sure to turn on the speakers. To run examples, find pages with names such as example1.html and upload them to your usual web browser. The big selling point behind downloading movies is convenience. You don't have to cut into a car, stand in line or spend a few days waiting while your DVDs travel back and forth between your home and the shipping center. But choosing a service that doesn't meet your needs can make the process pale in comparison to other methods of buying and renting. The first thing to keep in mind is the platform that the site requires. Most movie pages require Windows XP. Several will also work with Windows Vista or Windows 2000. Only the iTunes Music Store supports the Macintosh operating system, and none of the main sites currently support Linux. Most sites also require Internet Explorer and Windows Media Player. Although you can view most sites in Firefox, the MovieLink page will only work with ActiveX-enabled Internet Explorer. Amazon Unbox requires Microsoft.Net, and Vongo requires a proprietary application. Ad for many users, the next big deal-breaker is the page selection. Download websites receive their own movies from film studios, which own digital rights to movies. The site can't offer a movie without negotiating a deal with the studio. Some websites, such as MovieLink, have deals with a lot of great studios, so they have a wide variety of mainstream movies. Others, like Leprosy, have a selection of free, independent films, as well as studio releases that you can rent for a fee. Vongo is owned by Starz Entertainment, and its choice reflects only what Starz has the right to broadcast. When you find a site with a selection of movies you like, the next thing you need to look at is the quality of the movies. There are several measurements to keep in mind. One is the resolution, which is measured in pixels. The higher the resolution, the better the image quality. For example, movies in Wal-Mart's video download store have a resolution of 640 x 480 pixels, which is the lowest standard TELEVISION resolution. Wal-Mart also offers a reduced version for portable media players with a resolution of 320 x 240 pixels. You can also measure quality in bitrate, often measured in bits per second (bps). The higher the bitrate, the better the quality - the DVD bitrate is about 5 kilobits per second or 5,000 bps. Codec or coding program digital video, can also significantly affect video quality. However, sites don't always specify which codec they use. Finally, before buying or renting movies online, you should thoroughly read the terms of use of the site and familiarize yourself with its DRM. Some sites are relatively flexible. You can play movies on multiple machines, download them to portable media players and even burn to DVD. Other sites offer far fewer options - for example, Amazon Unbox received criticism shortly after launch for its perceived inflexibility of the terms of use. Several sites allow you to create a backup disk that will only be played on the computer that was originally used to download the file. For websites that use streaming media, you never actually own a copy of a movie, simply watching it while streaming. Once you've found a site that meets your platform criteria, selection, quality and terms of use, a few simple questions can help you make the ultimate choice: How much do movies cost? Are they as expensive as DVDs? If so, would you rather find a cheaper alternative or stick to higher quality DVDs? Do rental and purchase options match what you're looking for? If the site offers a subscription program, are there enough movies you're interested in to make it worth it? Are movies compatible with the portable devices you want to use to watch? Several sites guarantee that their files will play on any Microsoft PlaysForSure-compatible device, but others have more limited compatibility. Does your site use file format that you've had good or bad experiences with in the past? Do you need a proprietary download manager or player? If so, do you mind downloading and learning to use, or would you rather use programs you're already familiar with? Does the player have all the features you want – can you pause, go back and fast forward? To see a comparison of the offerings of some sites, see these articles from TechCrunch and ExtremeTech. Then we'll look at the movie download services that are now available. Milton Kazmeyer Whenever you connect to the Internet, you transmit and download data. The transfer includes all packages of data that travel from your system to another server on the Internet, while the download covers those packages that are flowing from external servers to your computer. For most users, this process is mostly asymmetric, with data downloading much easier and faster than the transfer process. During normal online activities, the computer constantly transmits and downloads data. For example, when you click a link on a site, the computer sends a small data package to the server to request a new page. The server responds by sending a series of packages that contain data for the page, the computer sends back a little support for each package received. Pod Pod circumstances, you will download significantly more data from the Internet than you upload. Since most users require more download capacity than transfer capacity, most consumer online accounts are asymmetric. According to PCMag.com, Verizon offered plans in 2013 with an average download speed of 34.5 Mbps while allowing only an average of 20.1 Mbps to upload. Usually, the discrepancy is even greater, with many internet service providers limiting transmission speeds to about 10-15 percent of their maximum download speeds. These companies use their excess output bandwidth to serve business customers and to hosted content on their servers. One of the side effects of these asymmetric internet connections is that it's easy to flood your available upload image, which can slow your downloads and browse the internet to crawl. Each time a server sends information about your computer, your computer must acknowledge its confirmation before more data arrives. If you load a file at maximum speed, the packages you send can squeeze out these confessions, slow them down, and reduce the speed of incoming packages. BitTorrent is a notorious source of congestion, as the customer will load at the maximum available speed and stop all other internet activities. Whenever you upload a file, set the maximum bit rate to several kilobytes per second below the maximum speed to allow enough above your head to prevent congestion. When you buy an internet service, your ISP will quote transfer and download speeds, but these are the best estimates. Latency and delay anywhere in the global network can affect the speed at which any data stream reaches your computer and affect your transfer speeds. Your speeds can fluctuate significantly, especially in prime time when many users download data at once. Speed testing sites transmit test data back and forth to your computer and give you the latest snapshot of the bit rate and downloads of the connection. Be sure to turn off any file or program transfers that can access the Internet before testing to get an accurate picture of the transfer prices. Rates.
