60 inch tv stand with mount

Written by Theresa Leschmann Many alternatives to TV departments exist; some can be used as such, while others can be easily customized. Some can only fit smaller series, and others support larger series. Choices are limited by your budget, sense of style and imagination. Some songs may already be in your home, while others require a purchase. A bar cart with an upper shelf and one to two lower shelves is a good choice for a smaller TV. If it has only one lower shelf, you may be able to modify the cart to support the other shelf. This would allow it to support a TV and DVD player or game console. The bar cart is also portable, making it easy to store out of the way when not in use. A microwave cart could work the same way. A standing jewellery case would nicely support a smaller TV, although usually the boxes are not well suited for recording media items other than remote control. The cabinet is the perfect choice for a larger TV. Many come divided vertically on the shelf or one can be added. The TV is in the upper cabinet and the media can be stored below. Closing doors when not in use leaves attractive furniture in any room. The old dresser can be easily converted into a TV department. The boxes are excellent storage compartments for DVDs, video games and remote controls. A small dresser takes up less space, while wider can accommodate speakers or other media components. The old sewing machine cabinet can be called a TV stand. Some have storage compartments, while others may need to remove the interior and install shelves if additional storage is required. Art-deco look, consider a sturdy wooden art stand. They can be found in second-hand stores, art delivery companies and all over the Internet. The crossbar is adjustable, so you can raise or lower the height to your liking. You may need to add some screws to the upright position to secure the TV. The rack can stand against the wall or in the corner of the room, giving you more layout options, and it makes an interesting statement in the room. Home House & Components Parts of House Walls Family Handyman Install the flat panel TV yourself and save hundreds of dollars with these easy-to-use instructions for low-profile, tilt and full-motion fasteners. According to DIY experts at The Family Handyman MagazineYou, you may also like: Building a TBDOverview Flat Panel TV on the Wall is one of those jobs where a little expertise can save you a lot of money. Professional installation costs between \$150 and \$350 – plus the cost of the lock itself. But if you can handle accurate measurement and drive with a few screws, you can do the first-class work yourself in about an hour. We'll show you how the TV is on the wall. In addition, we sift through a confusing range and we will help you choose the version that is the best three styles Do not drown in all wall mounting pads and models. They're just variations of three basics. These three styles differ mainly in how much they allow you to adjust the screen position. Adjustments can remove glare and increase viewing comfort in other ways as well. However, adjustability is most important for image quality. Like a computer screen, the tv screen image is the clearest when viewed directly. So the fixation, which offers more adjustability, gives you a clearer picture on more occasions and can even add options where you can place your TV. Most flat TVs are designed for a wall-mounted TV, but definitely make sure yours is before you buy a mount. Look for vesa (Video Electronics Standards Association) in the manual or on the TV itself, followed by a number such as VESA 75. Any fastening with the same VESA number will work with the TV. Also consider wiring before choosing a lock. If you plan to use wiring inside walls, the structure of the mount can determine how and where you can install the socket and cable connections. Next, learn how to clean your TV screen. Low profile mountingBasic installations Profile brackets (\$25-\$150) hold the TV close to the wall. This reduces the barrier along the traffic lane and reduces the risk of TV damage or bruising. Installation equipment The downside of these fasteners is that they do not allow tilting or other adjustments. So if you're going to hang your TV way above the eyes, a low-profile fixation isn't the best choice. Pricier mounts only hold the TV 1/2 wall - more affordable models about 1-1/2 in. Tilt mounts More adjustabilityTilting brackets (\$50-\$200) allow you to install a TV above your eyes or adjust the angle to suit the situation – something you might want to do if you watch TV from the floor one day and the couch the next day. Installation equipmentMay-priced models are easier to adjust and can be placed at any angle. The more affordable models offer a few preset corners and are a little harder to adjust. It's not a problem if you rarely change angles, but a nuisance if you frequently make adjustments. Full motion fastening The most versatile optionFull motion fasteners (\$100-\$500) allow you to tilt, turn, pan and expand your TV. This means that you can pull the TV out of the wall and turn it left or right towards the viewer. Recess installationFull-motion fasteners can be mounted on the wall or recess as shown in the figure. Mounting equipment The bracket is folded into the box, bringing the TV as close to the wall as a low profile attachment. The box also provides a neat exit point for the wall wiring. Height or higher? It takes three people to install a TV. Once you have found the right spot, mark one angle with tape. Set aside the TV and add tape to mark the bottom edge and the other corner. Most common error when choosing a place on your TV sets it too high. Looking at the screen can give you a sore neck and a blurry image (especially if the TV mount doesn't tilt). Some experts recommend concentrating the screen at eye level (when you sit down). Others say that a little lower is better, so the eye level is centered on two-thirds of the TV (that's where most of the screen action is). But there's no real height. A lot depends on the size of the TV and the room. A large TV in a large room can be installed on a higher wall, as the upward viewing angle decreases when you sit further away from the TV. So, the best way to choose the installation height is by test drive. This is a three-person job - two keep a TV and a third to assess the altitude. Just go to the viewing position and look at the screen in different positions on the wall. Once you have found the right place, mark the position of the TV on the wall with tape (Fig. 1). Then set aside the TV and add tape to mark the bottom of the TV on the wall. The tape must be completely flat, so set it to a level. Also locate the center villains of the wall pin with an electronic stud seeker (stud centers provide maximum grip power). If you have concrete, brick or block walls, you can drive the screws anywhere. See the instructions for anchor recommendations. Place it perfectlySen the location on top of the bracket wall plate. Measure from the right edge of the TV to the bracket. Move the measurement to the wall. Then find the nearest dot and drill. Most wall panels allow you to slide your TV left or right a few inches, so the disc doesn't have to be perfectly centered where the TV hangs. But installing a plate at the right height can be tricky. Many people end up installing it two or even three times before they get it right. This avoids wasting time and a wall full of screw holes:First screw the fasteners onto the TV as instructed. The screw hole on the back of the TV can be hidden by plastic plugs. Wrestle them away. Then hang the wall plate on the brackets so that the entire mount is attached to the TV. Push the TV against the wall and measure the distance from the bottom of the TV to the center of each row of mounting holes on the back plate. On the wall, measure the same distances up from the tape and make traces of the post. Check the marks on a flat level to make sure they are completely flat (horizontal). Then follow the picture. Drill holes in the marks. The holes should be about 1/8 smaller than the screws. If the manufacturer does not include lag screws, check the instructions and pick up the recommended size from the hardware store or home center. Then screw the plate into the wall with a ratchet, wrench and socket.
