You don't switch away from your PC to your smartphone to reply to an email or immediate message, so why should a simple SMS message be any different? Fortunately, if you have an android device, you can continue to use your computer (and its full spacious keyboard) to read and send text messages. Our pick for this task: MightyText.MightyText Platform: Android, Web, Chrome Price: Free ($4.99/month Pro) Download PageFeaturesSyncs SMS and MMS on Android Phone and WebStores messages up to 6 months free (forever for Pro users)Syncs contacts with phoneSyncs photos and videos from your phone gallery, with editing and filtersAdd emojis and quotesFavorite textsDefault list of view, grid-based power presentation for multiple conversationsBattery indicatorNotifications for incoming callsDial number from the Internet (need to phone to talk) Ring phone to find itChrome extension to send messages from Gmail and Facebook chat windowsSchedule text messages to send later (for only) Save message templates (only for)25 people at a time (only for)Add signatures (only for)Block certain numbers from sync with MightyText (only for)11 additional topics (only for) Where it excels all different text messaging PC solutions for Android MightyText is the easiest to use. Install it on your Android, log into Gmail, light up the web app and you're ready to go. The app hooks you up with it's just running charm and then unloads some handy extra features to keep you happy. Big seller, how easy it is to sync your text messages, whether you're connected on Wi-Fi or using a data plan. Power View makes it easier to have multiple text conversations at the same time. Also, if you use a Chrome extension, it will give you pop-ups when you're in Gmail or Facebook tabs, just like the incoming chat messages looks in those windows. And you can compose new messages too. The Pro version ($39.99/year or $4.99/month) takes it up a notch with the ability to schedule messages and save template-like useful features that cost money if you text a lot. Where it lacks search. This biggie is missing from MightyText and there seems to be a good explanation for why you can't search through all your text messages even if they're right there. It's not even available in the Pro version. A pre-installed gallery of GIFs, videos and more is limited, doesn't have much material, and there seems to be no way to add your own to it, but we're not too broken about it. MightyText also has some problems with MMS on phones that don't use the messaging app, so if you're using a text messaging replacement for Android, you may have to turn it off by default to solve the problem (at least according to the READ MORE QUESTIONS). G/O Media can get a commissionMario Kart Live: Home Chain It's been time since we last looked at Android replacement text messages. Our previous... More Competition If search via text message is important to you, then AirDroid - which is a complete Android-to-PC management solution (not just text messages) - is your best option. One of the main features of Android remote control over the Internet is reliable support for text messages, as it indexes all your messages and conducts a quick search. However, MMS support on AirDroid is weak in both sending and receiving files, especially if you're sending messages to a non-Android phone. In our tests, MMS messages sent to the iPhone and BlackBerry didn't go through at all, and the BlackBerry MMS didn't come through either. Android: We mentioned AirDroid 2 public beta a few months ago, but the new version is finally ... More popular second option DeskSMS, but there doesn't seem to be much reason to consider it, especially considering it requires an annual subscription of $5. Both MightyText and AirDroid are the best options, but it has one thing going for it: integration with Google Talk/Hangouts. In addition, it has got an excellent tablet app called TabletSMS that basically allows you to process text messages on an Android tablet. And obviously one of the best alternatives for text messaging from your computer is using Google Voice. However, while Google Voice can do a lot of other things like forward calls, integrate with Gmail for VOIP, and other things like that-its texting features are pretty mundane. Google Voice doesn't support MMS (except Sprint), its text messages have a lot of strange errors (like splitting messages and showing them out of order) and generally just not that special. If you want to use MightyText but still get other google voice features, there are other ways to get these features. Google is not updating the voice in age. Once heralded as an amazing service that will unite our ... Lifehacker's App Directory is a new and growing catalog of recommendations for the best apps and tools in a number of these categories. Hot on the heels of Android 11 Developer Preview, Android Studio 3.6 is now available on a stable channel, which means that developers can start making confident use of it for their projects. This brings a number of useful features and updates, including the new Split View's Design Editor for faster design and preview of XML layouts. Another exciting new feature is the support of several displays in the Android emulator. Automatic memory leak detection time promises to make debugging, which is much easier. You can check out the full array of features from the Android Developers blog, or get the highlights below. Split View and EditingPerhaps The most interesting new feature in Android Studio 3.6 is Split View for Design Design This allows you to see the XML code side by side along with the preview render. It's a small thing, but in fact it makes life a lot easier to view the effect that changes the code right away (and vice versa). The view you choose will also be saved on a case-by-case basis, which means you can easily download the preferred setup depending on the file you're editing. While we discuss design, we should also note the new color collector, making it much easier to select and fill color values without a set of values. It's available through the XML editor and design tools. Faster development When it comes to development, a few new changes should make life easier for Android Developers in Android Studio 3.6.View Binding is a particularly welcome inclusion that will offer a compilation of security time when linking to opinions. With this option, you'll create a binding class for each XML layout file in the module. This will actually replace the need for findViewByID: you can easily refer to any type of ID without risking zero pointer exceptions or class exceptions. This can prove very useful and reduce a lot of patterns. Other new updates include the release of the IntelliJ 2019.2 platform with better launch time and new tool services, as well as support for Kotlin for more Android NDK features. Updates to the Android Gradle plug-in include support for the Maven Publish Gradle plug-in. This allows you to create artifacts in the Apache Maven repository. Testing and debugging Android Emulator 29.2.12 makes it easier for developers to interact with the location of the emulation device. Google Maps is now built into the advanced control menu, making it easy to specify locations and create routes. Perhaps more appropriate is still the support of several virtual displays that will be useful for those designing for devices such as Samsung Galaxy Fold.Read also: Development for folding devices: What you need to know, memory detection Profiler will detect activity and instances of a snippet that may have leaked. Build time has also improved for debugging builds thanks to the use of zipfinger. A better quality of life changesIt's only a small selection of updates available in Android Studio 3.6. You'll find plenty of other small updates as you use the new software too: including the resumed SDK downloads, which is perfect for those who don't always have an hour spare to download the latest Android image! Grab Android Studio 3.6 here. Of course, on the Canary Channel you can already get your hands on Android Studio 4.1. What do you think of these new features? What would you like to see come to Android Studio in the future? Over the past decade or so, Calls have become extinct as our primary form of communication with most people, with text messages as a substitute. And if you're going to use as much as you do, you might as well use the best apps to do so. Let's talk about them. Best for most people: Android Messages Android Messages vision Google for SMS applications on Android, and the stock version on Nexus and Pixel devices. The good news is that it's available in the Play Store, so it works on any phone and it's totally free. What makes this app such a good choice is its clean, minimal interface - it just works really well. It's not filled to the brim with superfluous features, it just does what it does. Indeed, this is what most of us have come to expect from Google apps. Like all good SMS apps, it supports MMS (multimedia messages), but it also has a few other tricks up its sleeve. This allows users to attach the following messages to their messages: Photos and GIFs Of Stickers Voice Recordings Data You can also set up conversations by assigning certain colors to contacts, but it will also do it for you automatically if you don't want to be bothered by the setting up of each contact. After a while, you start to associate each contact with their color, so you can take a look at your phone and know exactly who the text is just by color. It's a simple feature that just makes sense. In short, if you're looking for simple text messaging apps that just work, this one is for you. Best for convenience: Facebook Messenger is almost all of us on Facebook, and if you're anything like me, you use Facebook Messenger almost as much as SMS to talk to friends and family. But here's the thing: you can actually do both things directly from the same interface, since Facebook Messenger supports SMS. It even has what I consider the best feature of the app: Chat Heads for text messages. So you can combine all your messages in this one place. I'm digging it. If you're already a Facebook Messenger user, you can easily include SMS in the app to give it a try. First, open the app and click on the profile picture in the top right corner. In this menu, scroll down and find a text message. Click on this and then click on the SMS slider in Messenger. A pop-up may ask if you want to use Messenger as a default customer- just click Yes. All kinds of new options will be available after that, so feel free to customize it to your liking. Otherwise, you're ready to start using SMS in Messenger. It's also worth noting that aside from the usual Messenger features (such as Chat Heads), Messenger also does this cool thing where it groups together business SMS-any kind of texts that you get from businesses with promotions etc. Your food is cleaner. I think it's pretty cool. Also, if you just want to see SMS and keep your Facebook messages from your feed, just click the SMS button at the top next to the profile picture. Bam. Oh, and it's free. Hard Hard that price. Best for Power Users: Textra If you're looking for all the bells and whistles from you SMS client, then look no further than Textra. This thing is chock full of killer features, but it still somehow manages not to feel bloated. But actually, I think that's what makes Textra so great: at first glance, it might be as simple as you want it to be, but if you feel like digging in, you can really customize it to do a lot more. Out of the box, it has a clean, dark interface. But if you're not that it has supportive themes like, dark, black, and even smart mode that will light up during the day and switch to night mode at certain times. You can also fully customize the color palette used, as well as the chat bubble and color icon. So if you're into aesthetics, you can pretty much get Textra to look the way you want.   But there's a lot more to be honest, more than you would feel like reading if I tried to cram it all into this post. However, here's a quick list of some of my favorite things about Textra: You can rename group texts. You can specify the limit of sending mmS messages, and Textra will shrink accordingly. Sent sounds are optional. It supports blacklists of numbers. Fast answers, notifications, and everything else related to notifications is customizable. It has scheduled messages. ... and really, this is just the beginning. Like I said, if you're a power user, this is the app you want. There's only one drawback: the free version has ads that appear as the first entry on your SMS list. It's really annoying. But there's $2.99 in app purchases that removes ads that are easily worth the price if you find that you're digging this app as I dig this app. Now, armed with this new knowledge, go ahead and text.
