Before you get to the list of the best improvements to the Ruger 10/22 charging handle, let's look at its formation. As the near side of 60 years of continuous production, the Ruger 10/22 rifle system remains one of the most popular firearms in the US. While popularity is undoubtedly driven by myriad aftermarket mods and support (it is actually possible to create your own 10/22 clone from a mail order file except receiver, of course: which is also available from third-party sources through FFL transmission in the US). But there would be no reason to support it if the design of the weapon was not one of the most reliable platforms available. In fact, aftermarket support is so ubiquitous 10/22 rivals ar15 and glock pistols when it comes to customization. However, while these other gun designs are chambered in a batch of class service, the .22RF will undoubtedly see more and widespread use in the very nature of it being in the affordable. .22 Long Rifle Chamber. As a result, 10/22 sees longer and more intense use. A return to the 60-year history of production with precious little changed in the standard model: 10/22 is a workhorses that calls for modifications for personal use. Why do you need to upgrade the charging handle for Ruger 10/22 Of course, if the original platform works so well, why bother with the upgrade at all? The first answer is that we can. The second is that while the basic model works admirably well, it is a basic model that can certainly withstand some adjustments to the individual needs of the shooter and applications. Furniture, barrels and triggers are obvious features that are aimed at, but there is also consideration for charging handles. While perfectly serviceable for small framed shooters or novices, the factory installed charging handle is a little too modest. Larger size enthusiasts, especially those looking for a competition weapon where speed is a necessity, or tactical shooters, where the economy of movement is desirable understandably find the levers of the stock too easily missed, or too hard to maintain positive strength to do so in quick or stressful scenarios. Larger screw handles become a necessity. What to consider when upgrading ruger 10/22 charging handleSeveral features of the replacement charging handle should at least be considered before settling to choose from. The first to consider is ergonomics - even the enlarged handle of the screw may be insufficient for consumers with large hands. The small handle may be too close to the action causing the skin joints or even slip. While billed as two-sided, its small size can be difficult for left-handers to understand and manipulate while maintaining gun control. So finding one big enough to be usable without being a threat is important. Improved mechanics should also be a factor: the stock charger transfers power to the screw using the 1/16 pin known after a long period of intensive use. Anything that replaces or upgrades that pin with something more substantial is a plus. Style should be the last... or at least almost the last: but if the other three functions are taken care of, then there should be no room for complaint. What follows is a small selection of popular and available models. Ruger 10/22 Charging Handle UpgradesPower Custom offers a direct extended charging handle in three formats: blue, stainless steel and skeletonized. Although not glamorous, of course, it supports the function through the mold: the handle comes out further for better ergonomics when charging or cleaning the action with both hands. It is offered with hardened spring guide rod and heavier spring is available with increased power for better feeding. Ergonomics: 4/5. A more significant lever is what is being sought, and it brings. While it may not be a tight knob, the curved trigger style like offers a familiar feel. Double-sidedness: 4/5. Coming out further gives right-handers more space to make contact with than the population model: definitely a step in the right direction. Improved mechanics: 3/5. It still uses the same gear pin of the original. At least it's a simple fix if needed. Style: Variable. Since style is a personal destination, the overall appearance of this model is traditional with some deviations in the target and skeletonized version. Also from Power Custom is a competition extended screw handle with improved strut spring mounting included. The elongated handle goes further – approx. .25 than the basic model – for positive connection and style, straight screw or pin, ironically allowing better handling than the curved surface of the original: energy is transferred to direct back movement. As the name suggests, it is ideal for competitors. Ergonomics: 4/5. The straight-pin design offers simplified mechanics regardless of whether the charging hand returns directly backwards or at an angle. Double-sidedness: 4/5. As with any extended version, coming out further gives right-handers more space to make contact with than the population model: still a step in the right direction. Improved mechanics: 3/5. Models reviewed still use the same transfer pin of the original. At least it's a simple fix if needed. Style: Variable. Since the style is a personal destination, the overall appearance of this model is simplified with a straight lever that offers improved mechanics. Volquartsen's prominent 10/22 custom store offers both upgrades and completed rifles and is one of the more common sources of 10/22 platforms in alternative calibers, including .22 WMR and .17 HMR. For the .22 LR, their Blued Extended Bolt Handle with Recoil Spring offers 1/4 longer range and a solid, straight screw handle that's simplified and securely comfortable. As with handles above, this is a straight rod ready to capture the energy of the charging hand with minimal power loss. Ergonomics: 4/5. Again, a straight pin as a design offers simplified mechanics, whether the charging hand is coming straight back or at an angle. Double-sidedness: 4/5. As with any extended version, coming out further gives right-handers more space to make contact with than the population model: still a step in the right direction. Improved mechanics: 4/5. The dislocated bit is polished and coated with titanium nitride, which not only increases hardness, but also self-lubrication. The spring is cryogenically treated even for longer service life. Style: Variable. Since the style continues to be a personal commitment, the overall look of this model is simplified. Force Productions offers a wonderfully priced stainless steel competitive model in stainless steel shares similar features to the above competition models, including a direct handle, albeit with the addition of deep grooves for better grip. In addition, with a hardened guide rod, this kit offers a hardened carbon steel guide pin that is stronger than pi stock and a common source of failure. Ergonomics: 4.5/5. Again, a straight pin as a design offers simplified mechanics, whether the charging hand is coming straight back or at an angle. However, deep grooves offer another hand purchase. Double-sidedness: 4/5. As with any extended version with a straight handle, coming out further gives right-handers more space to make contact with than the stock model. Improved mechanics: 4/5. The hardened steel bar and transmission pin are the source of mechanical failure related to the charging handle assembly. Style: Variable. Since the style continues to be a personal commitment, the overall look of this model is edgy: polished stainless steel and deep grooves declare an upgrade and impressive aesthetic. Tandemkross offers an advantage for their advantage of the charging kit. This accessory allows use with your left or right hand. The Picatinny rail, which is mounted over the top of standard 10/22 receivers, offers space for virtually any rim capable of optics. It also offers a charging handle for left-handers for their off hand. Note: this does not turn off the ejector opening (wear safety glasses, southern pats), but offers 10/22, which will work in a way designed for them and a more natural method for removing jams and chamber charges. Ergonomics: 4/5 FOR LEFT-HANDERS. The size of the charging handle is not much different from the stock model, all it does is offer a handle on the left side of the firearm. The standard charging handle actually stays on the right side. Double-sidedness: 4/5 again for left-handers. It is a left-handed conversion that offers the same advantages and disadvantages of a standard screw carrier handle. Improved mechanics: This is an option for left-handers. Long-term field use still needs to be done when it comes to splitting the conversion assembly from extended use: to date, it is no worse than Ruger's parent product. For left-handed shooters tired of living in the world of righties, it offers what must be a welcome respite. But it doesn't offer much that actually improves gun performance in itself. Style: Variable. The rail offers a welcome addition for the red dot and a fast and ready tool to make the rifle more comfortable for right and left-handed shooters. Aesthetically, it makes the receiver bulkier: it can be a good or bad look depending on the preferences of the owner. The Power Custom also offers an extended heavy screw handle and a spring for the .17 HM2. Since the HM2 can be used in the same receiver, barrel swap and screw carrier mounting are all that is needed to use high wheel speed. The heavy tungsten handle adds mass to the extra energy, so a screw can be used. This is a must for anyone who wants to increase the diversity of calibers on their stock platform. Ergonomics: 4/5. To add mass, a larger straight screw is used and undoubtedly gives visual information about which carrier is installed. The advantages of the direct handle were discussed above. Double-sidedness: 4/5. The larger screw is somewhat difficult to miss. Improved mechanics: 4/5. For anyone installing a 17HM2 barrel, it's almost a necessity as using a stock screw and springs will lead to abuse along with feeding and extruding issues. Style: Variable. The darke surface and hefty bold handle indicate their own work, as well as a quick indicator of which caliber the rifle is set to. As mentioned above, platform 10/22 has existed for almost six decades, although only recently has an obsession with the aftermarket been adopted. While the basic model, like most factory variants, continues to serve exceptionally well as trainers, plinkers and competitive rifles, it is only natural that such a tool will be used long and often. While regular wear and tear can trigger an upgrade, many Ruger owners buy a basic model with the intention of replacing stock parts almost immediately. Immediately.
