Baja no pinch tire tool amazon

Home Forums Home > Bikes > Thumpers > Discussion in 'Thumpers' started by Benduro, March 11, 2016. Home Forum Home > Bicycles > Thumpers > No more trapped tubes when installing a tire. Powerful rack and pinion system. Custom CNC components processed in the USA. 6061 anodized aluminium support and light weight chassis shaft. Steel handle and bead push rod for high strength. Black oxide treated for surface protection. Strong and lightweight weight system – perfect for taking on the route or off-road. Total weight 1.8 pounds - hardly visible in the package travel. Get the hassle out of installing tires. The Baja instrument is equipped with a 20 mm shaft. If you need a different size, please order either the 25 mm sleeve or the 17 mm shaft accessory. Note: The 17 mm sleeve is perfectly designed to screw and replace the 20 mm shaft that comes with the Baja tool, and the 25mm sleeve is meant to fit over the original 20mm shaft. The trapped inner tubes are history when you install a motorcycle tire with the Baja No Pinch tool the tool breaks down into three parts, the longest part being 12 inches. These pieces will roll in a compact package and at 1.8 pounds are hardly visible in the journey or fanny pack. Pour some talcum powder into the tire and turn the tire to cover the interior. This will help the inner tube to slide into place. Screw the valve rod into the inner tube and gently inflate the inner tube. Step 3. Place the inner tube in the tyre. Step 4. Push the valve rod through the rim hole and screw the valve cover. This will save you trying to get the valve strain in later, when getting your hands under tire beads can be a very difficult job. The No Pinch tool is a great help to mount a tire in this way. Step 5. Starting with the rim lock, push the bottom bead over the rim and under the rim lock. Continue to push the tire over the rim as much as you can with your hand. Step 6. Use the No Pinch tool to push the bottom bead over the rest of the rim. Lifting on the bottom of the tire, to get the tire beads from the bottom in the center channel of the rim, makes it easier for the tire beads to slide over the rim. Step 7. The beads of the bottom tires is now almost all the way over the edge. Step 8. You're halfway there! The lower tyre heel is completely over the rim and the valve rod is installed. Step 9. With the rim lock placed at the top, start pushing the tire bead over the rim at the bottom at 180 degrees of locking the rim. You can usually get started by both hands or, you can use a tire iron if necessary. Step 10. Using the No Pinch tire tool, push the tire over the one or two centimeter beads on one side, and then do the same on the other side. This way you work with tire beads over the rim, work each side evenly towards the top and lock the rim. Step 11. IMPORTANT: It is important to stop regularly and push the tyre section below the down into the rim channel. This shortens the distance of the tire beads you have to stretch to get all the way over the top of the rim and make the job much easier. See additional resources at the bottom of the page – When Going Gets Tough Step 12. POSITION OF THE WORK: Pushing down on the handle and pushing at the same time. This keeps the red support on the wheel hub and the pusher pushing the beads outwards over the rim. This is critical at this stage of the tyre holder. See: When Going Gets Tough at the bottom of the page. Step 13. In this photo tire beads is almost all the way across the edge. Step 14. Push the rim lock into the rim before pushing the tyre heel over the rim. Step 15. Tyre fitting scan is complete! Don't forget to tighten the rim lock. Step 16. Draw & wheel back on. Ready to break . . . TIPS FOR CHANGE WITH SUCCESS OF ANVELOPES USING THE BAY NO PINCH TIRE INSTRUMENT Use the appropriate tools. You will need the following: quality tire irons for the removal of the Baja No Pinch Tool tires for tyre installation (note: you can also request the 17mm steel shaft or 25mm sleeve depending on the diameter of the wheel bone) key for the stem tool lock valve to remove the stem valve talc soapy water powder or Windex tires changing the stand - useful, but it is not necessary a warm tire (cold tires are very rigid and difficult to change) patience and practice Installing tires PAS ONE inflate the inner tube just enough, so that it has a slightly soft shape, round sprinkle the talcum powder inside the tire or on the inner tube (this helps slide the tube inside instead) place the inner tube inside the tire pull the stem out of the tire enough to push the stem up through the pipe rod hole in the rim screw a nut rod valve or valve cover on a few wires so stem remains outside the rim hole tuck the inner tube all the way around inside the tire push the beads down the tire up in the wheel channel to the valve rod while at the same time pushing down over the rim - the bottom tire beads will now be side over the edge start using the tire tool No Pinch to push the bead tires the rest of the way over the rim. Make sure that the car is fully inserted into the wheel chassis opening. The red holder should be touching the wheel when in use guide no knife tip bead tool push the rod with one hand and pull on the handle of the instrument with the other keeps the pressure down on the bead pushing rod with your hand - pushing down the bead push rod keep the tool holder in contact with the wheel hub and will help ensure that the tool is correctly pushing outwards and not down With the bead push rod will keep the bead push holder in contact with the wheel hub and will help ensure that the machine pushes properly outwards and not down with the bead push rod against the tyre, pull the handle back to push the tire over the rim. Start near the point where the tyre has to go over the rim and push the tire over the rim an inch or two at a time. After every 2 or 3 push do the same on the opposite side. stop frequently and push the tyre down on the rim to get the tire tire in the rim channel -pushing down the wheel just behind where you work with the tire tool No

Pinch is the key (rigid side wall, the more important this is) continue until the bottom beads of the tire is completely over the rim tip - this method saves having to squeeze your hands between the tire and rim getting the valve stem into the rim hole later - it's already done STEP TWO turn , wheel 180 degrees, so the valve rod and rim lock are at the 12:00 position starting at the bottom (6:00 position), start by pushing the tire under the rim - this takes a push well and on a very stiff tyre you might have to start using an iron tire make sure the tire beads drop all the way down into the channel in the center of the rim start using the No Pinch tool to push the tire over the rest of the rim. Make sure that the car is fully inserted into the wheel chassis opening. The red holder shall touch the wheel when it is in use guide to push the No Pinch tool with one hand and pull on the handle of the machine with the other keep the pressure down on the bead push rod with your hand With the bead push rod against the tyre, pull the handle back to push the tire over the rim. Start near the point where the tyre has to go over the rim and push the tire over the rim an inch or two at a time. After every 2 or 3 push do the same on the opposite side. Always stop after doing the above and push the tire down into the center of the wheel channel - pushing down the right of the tire behind where you work with the tire tool No Pinch is the key (rigid side wall, the more important this is) do so from the bottom of the tire and work your way up on both sides where the tire is still on the side of top of the rim - this ensures that the beads is completely inside the central channel continue repeating while working towards locking the rim for very stiff side walls you can use some soapy water or Windex on the tire beads below if you use the tool - this will give the tire a better chance of sliding into the center channel pushing down the bead push rod will keep the tool holder in contact with the wheel hub and will help ensure that the tool is correctly pushing outwards and not down make sure that the rim lock is pushed up into the tyre so that the tire heel can slip under the rim tighten the lock rim inflate the tire while using soapy water or Windex to make sure that the beaded seats properly at the top The latest Top reviews Stop pinching tubes when installing a tire. Powerful rack and pinion system. Custom CNC components processed in the USA. 6061 anodized aluminium support and light weight chassis shaft. Steel handle and bead push rod for high strength. Black oxide treated for surface protection. Strong and lightweight weight system - perfect for taking on the route or off-road. Total weight 1.8 pounds - hard hard in the package. Get the hassle out of installing tires. The Baja instrument is equipped with a 20 mm shaft. If you need a different size, please order either the 25 mm sleeve or the 17 mm shaft accessory. Note: The 17 mm sleeve is perfectly designed to screw and replace the 20 mm shaft that comes with the Baja tool, and the 25mm sleeve is meant to fit over the original 20mm shaft.
