the bulb can vary as smoothly as it is controlled by a variable resistor. However, unlike using variable resistance for the same operation, there is little energy wasted when controlling power using fast switching transistors. This power control mode is commonly called pulse width modulation or PWM. Explains why PWM power control is much more efficient than using a series of resistors to control load power. According to Ohm's law, voltage V across the dosing of resistance R is proportional to the current passing through the resistor (see circuit below). The relationship is recorded as $V = R I$, you can also write in $I = V / R$ and $R = V / I$. The unit is in volts (V) for voltage V , Amperes (A) currently uses Ohm's law to solve simple circuit problems for I and Ohms (Ω) and uses Ohm's law to solve scabies's law, if the resistance $R = 2 \Omega$ resistor $R = 2 \Omega$ resistor is 6 V. Example 1 The solution to alternative R is ohm's law $V = R I$. $6 = 2 I = 6/2 = 3$ in circuits below Example 2, the resistances of R_1 and R_2 are 5Ω and 10Ω . Resistance R_1 has the same voltage as 4V. Solution to Example 2 We use Ohm's law $V = R I$ to find the current I_1 that passes through R_1 . $4 = 5 I_1$ $I_1 = 4 / 5 = 0.8$ A Two resistors are in the series, so the same current passes through it. Therefore, with R_2 , the current I_2 is the same as 0.8 A. Now use Ohm's law to find the voltage V_2 of resistance R_2 . $V_2 = R_2 I_2 = 10 (0.8) = 8$ V Example 3 resistor R_1 and R_2 have resistances of 8Ω and 4Ω respectively. The current passing through R_1 finds a voltage that passes through the resistor with the same current across 0.2 A. Resistor R_2 . Example 3 Solutions uses Ohm's law $V = R I$ to find voltage V_1 for resistance R_1 . Across voltage and resistance R_2 across $V_1 = 8 (0.2) = 1.6$ V resistor R_1 , the voltage is the same because R_1 and R_2 are in parallel. We now use Ohm's Law to find the current I_2 that passes resistance R_2 . $1.6 = 4 I_2$ is solved when the voltage of the same resistor is 5 V when the current passing through the resistance in the I_2 $I_2 = 1.6 / 4 = 0.4$ A Example 4 circuit is 0.01 A. What is the current passing through this resistor when the voltage is 7.5V? The solution to Example 4 is to use Ohm's law $V = R I$ to find resistance R in this circuit. $5 = R (0.01)$ $R = 5 / 0.01 = 500 \Omega$ We now use Ohm's law $V = R I$ and R values to find the current when the voltage is 7.5. $7.5 = 500 I$ $I = 7.5 / 500 = 0.015$ A Example 5 Below graph shows the voltage V of the resistor for the current passing through the same resistance. What is the resistor's resistance in the circuit? Example 5 Ohm's solution to law $V = R I$ is similar to the line equation in form $y = m x$, and we know that m is the slope of the line $y = m x$. Therefore, in the V graph given above, the slope of the graph is resistance. You need two points in the graph to find the slope. Points (0,0) and It can be used to form graphs to find slopes, and therefore resistance $R = (10 - 0) / (1 - 0) = 10 \Omega$ more references and the law of linksum and the law units of the power calculator ohm are in volt v for voltage v amperes current i and $om\omega$.
