## Final burn alpha rg350

🔒 Final Burn Alpha or FBA is an emulator of various arcade machines, mainly Neo-Geo, Konami and Capcom. Let's take a look at how to install and configure it on the RG350 console. The repository where a special version for RG350 is released is this one. In particular, posts are downloaded from here. On the asset side of each emission we can find an OPK created primarily for this console. Installation- Installation is like any emulator in OPK format: Download OPK to RG350 from the latest release. At the time of writing this article is: fba-RG350-r19-8e351b8b.opk Copy into the external microSD application directory. It can also be copied to the internal card (in path/media/data/application, but I personally prefer to install the application outside). Once installed, restart Gmenu2x by pressing Power+Select to ensure that it appears: Settings – The first time we opened it will show us the 5807 ROM that it can recognize (at least in R19), but it certainly won't allow us to open it and will represent them in red. If we press the X key (and not Y as suggested by the program itself) we will see the help explaining that the ROM appears in the missing red, that is, they are not located in the console. The ROM route must be configured in the FBA settings. To do this follow these steps: Press Start. Primary Settings appear. We're down to select ROMS ROUTE input --&gt;.: Enter with A to see a 20-route series that allows us to configure the FBA. As we see, by default it has several common routes that have been defined. Interestingly the route number 4 will work on my machine when I have an external card in FAT32 format, because my FBA ROMs path is /media/sdcard/roms/FBA and the format is insensitive: Clean the path that doesn't serve us by selecting and researching them with the X key: Select the first entry (for example) and press A. A. A type of file explorer will appear that will allow us to navigate through the directory structure. We'll go up the tree by choosing a two-point entry... until we get to the roots and then we will start going down the route that takes us to our ROM, in my case/media/sdcard/roms/FBA. Tree up and down is done with the A key. When we get to press the desired route Start: After showing at least one legitimate path back to the Main settings menu by pressing B. There we descend on the clear ROM list cache and the remarking option: This will take us back to the ROM list, but if in the configured route we have a legitimate ROM we will start looking at some names in yellow and/or These are the SOCS that emulators can run: if we have a full FBA romset that supports the version we have installed, install, Some red ROM that we won't be able to play. To hide them back to the settings menu with the Start key and enter the Filter Settings section --&gt; With A: On the new screen change the Show rom setting with the left/right key crosshair until the Available option only appears: Upon returning the ROM list (this time there is no need to cause rescanning) we will see only the ROMs we can run: Actually steps 7 to 9 can be done with the combination of the Y+Up/Down key that we will see next. Controls that appear on the help screen are described below. Combination Of Situation Functions Key Select Screen Listing Rome Output. Press again to confirm the ROMS Screen StartList primary settings Y+Left/Der.ROM Listing Changes the value of the ROM Hardware filter value Change the value of the GENRE filter, Changing the value of the ROMS browsing show Y+R1/L1 Rom Listing Filter Changes the value of the Genre filter, Changing the value of the ROM filter i.e. ROM Y+Select Rom Listing Add/Remove rom to the.ROM Y+A Listing option Add ROM Y+Start ROM LISTING FROM ROMS POINTS to favorites!!! Delete unverified ROM Choose By Running Rom Coin Start Player 1 Select +Start Running Rom Start Player 2 L1+R1+Y Running ROM Shows/Hides Frame Rate Per Second (FPS) L1+R1+B Running Game Status ROM Record L1+R1+R1 +A Running ROM Load Game Status L1+R1+Select Running ROM Service Menu L1+R1+Start Running RUNNING ROM MENU FBA SDL Key combination L1+R1+Start is important because it is the one that displays the application menu once we have booted ROM. It will be that allows us to make adjustments to control, save and restore game conditions and exit ROM to return to list: FBA preview, Like many emulators, support images to describe games you can run. In reality this function has a greater impact than in other emulators, because when you come loaded with a romset, that is, with the game database, even if you don't have a corresponding ROM, you can browse and filter the catalogue to see the preview. So let's take a look at how to install it. The key is to put them in directories/media/data/local/home/home/.fba/previews. There should be image files in supported formats (such as .png for example). The file name needs to match the name of the ROM it represents. The names are specified in the romset. The program shows them to us when we go through the list. For example: For this game will be previewed therefore the following files must exist: /media/data/local/home/.fba/preview/bombjack.png As we talked about 5807 ROM in FBA version 44, of course we cannot provide images one at a time. Or we got a preview pack (which you're looking for) or we tried to prepare it ourselves with Scrapper. If we choose the latter, the image should be generated with a size of 192x112 pixels, that is, without maintaining an aspect ratio. Let's assume that we already have a directory with all the images provided. Let's take a look at how to install it. We start from a directory with images on our computers. Rename it as a preview. Remove the external card from the console, tip it onto the computer, and copy the preview directory to the root of the console. Remove the card from the computer and click again on the console, it is turned off. After the boot opens the DinguxCmdr app. Navigate the directory until you put the route/media/small card and on other lines/media/data/local/home/.fba. At that point select the preview directory on the side that matches the SD path, press X, select Move &gt; and verify with A: As sure the directory will exist, we'll be prompted for confirmation to overwrite it. Select Yes to all and confirm with A: If as in my case. We have in the directory of more than 11,000 files, this process will take a while (about a minute): If everything has gone well, after exiting DinguxCmdr (key Y and Stop command), when opening the FBA we'll start looking at this: ROMSTM As we've commented, the FBA works based on the romset, i.e. the closed list of ROMS that it can run on a specific version. The ROM is identified by doing calculations with the contents of the file, so that if any minor changes are detected, the ROM is removed, appearing in the red in the list. To successfully debug a romset, i.e. finding missing or detected files as invalid, it is advisable to use a program that helps us in the task. This is called ROM Manager, where there are several, such as: Romcenter Clrnamepro RomVault Arcade Manager There are projects underway to list and identify FBA compatibility levels and xMAME romset games on RG350. You can search and collaborate through this Google Doc document. Like many emulators, some of the machines that FBA emulate require a BIOS that exists on boards, such as NeoGeo. Therefore, you need to get this BIOS (which you are looking for) and copy it to the same directory in which the ROM, that is, follows the entire example of the article, in my case it will be /media/sdcard/roms/FBA. NeoGeo BIOS actually consists of a set of files compressed into a neogeo name.zip. There is a modified BIOS for NeoGeo called UNIBIOS which when you open the game on this machine and press Select+Start cheat menu appears. You can also change the region and game language. RG350(RG350M) ゲーム パン ※ Operability to be perfect with the same performance, and prices get cheaper!!!! ※ [1] Pre-opening RG350P review When playing vertical screen games with the FBA in comments on Youtube, please tell me how to fix it because the game starts with the cross key in all ways, and it's easy to think that we didn't make an article, but I'll leave it in the article. First of all, when you start a game dedicated to vertical screens with the FBA (Final Burn Alpha), the game starts on the left side of the usual way of having like this, so naturally the fire button becomes a cross key. So do it this way. First of all, after choosing a game on the FBA, you'll see a screen like this, but pay attention to this section. I thought the Rotate item of the vertical game was Not at first. Convert this to -180. And when you start, yes, the game starts on the right side of the regular hold, so you can fire with an analog stick with your left hand and a circle button with your right hand, so it will be very easy to play. In other words, if you use this method, you can play even if you have frequently by changing the angle. It is a specification that can be achieved in a pretty itchy place, please refer to it. Purchase RG350 from here (I convert it to the cheapest and safest website right now because of the link I paste before expiry) You can buy RG350 for 8241 yen on the OVERSEAS EC site TOMTOP!
