Shot list template google docs

Resources / Movie Creation Templates Updated August 19, 2020 We have created a free listing template that you can use with Google Sheets or Microsoft Excel. This free download is perfect for any type of film production – from short films to music videos and everything in between. Google Sheets Shot List Template Perfect for any kind of film production - from short films to music videos and everything in between. Why are shot lists important? It's easy to get lost during a shoot, even with a small team. If you have a lot of settings, multiple actors and a big crew, then it just gets more complicated. A shot list keeps a project on track. Before filming, it helps directors gather their thoughts and create a filming plan. During filming, a solid camera recording list means that different departments can work independently of each other. It also makes it easy to carry on if a crew member is ill one day or has to leave the shooting. When you want to create an inclusion list, you should create your script, and create your storyboard at the same time. Your recording list will help you visualize what you want. It will make it easier to organize the cast, crew, equipment, and locations that bring your vision to life. (Side note: You need a few additional documents, such as call sheets, technical data, and license agreements—they're all from the shot list.) If you're looking for tips on how to create a storyboard, see our step-by-step storyboard guide. During production, you add notes to the recording list to help your editor—such as what needs to be used, detailed comments and shot/card numbers. Remember to add the clip number or timecode to the recording list during production. It will help your editor to know which recording is which one, and dramatically speed up the editing time. Remember to organize your recordings by location. Assemining similar shots makes shooting easier because you can shoot them all at the same time. (Note: This may not be in the order of the shot number. And that's okay!) This makes filming even more convenient – even if you don't take pictures in the order of your storyboard. What's in a shot list? A typical recording list contains: Scene: This is the scene number you will find in your script. You may not need it for smaller productions where everything happens in one scene. Setup: Add a new setup each time you reposition the camera or change the lighting. You can use these later to group similar setups together, making shooting easier. Shot: Increase the shot count by one each time you start a new shot. (Depending on your personal preferences, you can reset the shot number for each new setup.) Description: Use this column to guickly explain where you are in the script. You should say what the theme is – whether it's an actor, a group of actors, props or a setting. Then describe Action that happens involved all props, and what exactly the camera should capture. This description tells your director everything that happens in the recording so that everyone is on the same page. Equipment: Use this column to list the devices that support the camera. For example, tripod, Steadicam, drone, Dolly, etc. Motion: Use this column to explain what your camera is doing when it is not static, i.e. it is moving. For example: Static, Pan, Tilt, Dolly, Zoom, etc. Angle: Use this column to describe the angle of the camera in relation to the subject. If your camera is lower than your subject, it is a low angle. If it is higher than the motif, it is a high angle. You can also include other terms that help explain the angle, etc. Check out our guide to camera movements and angles to learn more about the basics of the camera. Shot size: Describe the size of your subject in the frame. Different recording sizes and their appearance in different orders produces dramatically different effects. A scene can start with a long shot to determine where it happens before moving to a center of the subject, then to a close-up of the plot. Shot sizes are often abbreviated, e.B. long shot (WS), very wide shot (VWS), mid-shot (MS), medium close-up (MCU), close-up (CU), extreme close-up (ECU). Audio: Use this column to explain how to record the audio. For example, Boom, Lav(s), Voiceover (VO). Lens: Use this column to record what size lens you are using. For example, 24mm, 50mm, 200mm. Time Estimation: Use this column to estimate how long it takes to set up each shot (not to shoot), which helps you create your schedule and schedules for each day. It will also highlight all time-consuming shots if you need to cut or change them during the day, such as changing a long boom for an elevated tripod. Camera: Use this column to remember which camera you are using more than one). Cast: Use this column to note which characters are in the recording. Best Take + Timecode: If you want to make your editor's life much easier, you can use these columns to record a great shot and when it happened. If you don't have a timecode, just change this column to Clip. Google Sheets Shot List Template Perfect for any kind of film production – from short films to music videos and everything in between. Unplanned, plan to fail shot lists is for the pre-production process Crucial. Like storyboards, they save time by creating consensus and keeping your team on the same page during production.
