Spotify for Android lost its home screen widget in a recent update, to the chagrin of some longtime users. If you want to replace Spotify for an Android widget, here are some ways to bring it back. Replacements for Spotify's home screen widget on Android Tasker and KWGT can create a new Spotify SpotWidget widget is a quick and easy replacement Since Android is a very flexible platform, there are many ways to bring back The Spotify Widget for your home screen, all with its own pros and cons. Here are some ways that can work for you. - This $2 Android app is an easy replacement for the Spotify widget By far the easiest way to replace the Spotify widget on your Android phone is to download an app called SpotWidget. While it's not free, costing $1.99 on the Play Store, the app works very well. Once installed, it's as simple as placing it on your home screen, giving it access to the notification, and hitting the play on Spotify. Album art doesn't work at times, but it's the easiest way to replace the Spotify widget I've come across so far. - Create a new custom Spotify widget with Tasker and KWGT Another method to replace the Spotify widget is to create your own. The combination of Tasker and KWGT apps and a few minutes of work brings back a new version of the Spotify widget. This method is a little tricky, but if you follow the step-by-step video guide below, it works quite well. The best part of this method is that it is completely free. It relies on access to notifications and a third app if you want album art. To get the design automatically, you also need to download the template file. Tasker's publisher, Joan Diaz, provides more context for this process on its website. Tasker, KWGT and AutoNotification are in the Google Play Store. It doesn't fit into cell phone wallpaper well. I hope you can change it. Take a look at the widget design of another music app that I use. Making the widget transparent just makes everything nicer to watch. They mesh with your wallpaper, they pop among app icons, and controls are easy to see and use. The problem with this idea is that, well, most music widgets suck. They are either harsh whites that cover the wallpaper, or they are too small to see your musical information easily, or they are just ugly. Fortunately, third-party apps are here to pick up the slack and turn it into a beautiful banner of musical magic. Here are the best of them. Before we get into our real winners, all of whom use KWGT Pro for additional customization as well as a standard and stable base, I have something for users who don't want the hassle of having a wySIWYG widget editor: Ubiquity Music Widget. It has two pretty standard widgets, and the 4x1 model even offers light settings, including allowing album art to define a color scheme. I traditionally go with clear, but with some themes you need an added transparent contrast. Ubiquity can pull in playback information and controls from more than just your main music player, meaning one playbook can control music, YouTube, or Netflix (during casting) depending on what is active. Ubiquity Music Widget (free, $1.99) Melody for Kustom This widget package is brand-spanking new, having been originally released just before the new year, and if the original offer is anything to go by, I'll use the melody in many, many, many themes for years to come. It offers 17 widgets out of 17 completed and ready-to-set Komponents, meaning that these widgets can be used in both KWGT, Kustom engine widget, or KLWP, Kustom Live wallpaper. The melody quickly won my heart theming over. The components are diverse, inventive, and most importantly, they have no more than two parameters to futz s. Unlike most widgets, The components of Melodi are not a giant folder of tangled shapes and text boxes, it is a complete widget. You can customize the color of the widget, maybe change the widget from dark mode to light, and all, just add a widget, size it to fit, and you're done. There's a lot to love here, but my favorites are: Melodi_12, a square widget that pulls its accent color from album art, Melodi_14 that can feel like a completely different widget when used either with a solid color background or is perfectly clear and Melodi_9, Uses a soft glow from album art and progress bar ring to give the widget a bit of pop. Melody for Kustom (free, $0.99) Material Music Komponent If you've been following our themed packages for about the past year half, you've undoubtedly seen Preset for our themes, using Komponent Music Material to get a perfectly themed music widget that can be easily applied to your phones. Material music still has a special place in my heart. This package has 3 ready-made Komponents for their widgets, and they come in three sizes: large, regular and compact, and regular komponent is the one we most often used. The controls are large and easy to hit, and you can color each part of the komponent separately and easily. In short, it's stuff, it's an easy theme and it's free. Yes, it hasn't been updated since 2015, but most Kustom widget packages aren't actually updated after adding ready-made Komponents. Material Music Komponent (free) KMusic and KMusic 2 KMusic is a series of widget packages for KWGT that use a wide range of styles. Some widgets are based on popular music apps such as Spotify, Play Music and Apple Music, while others are completely original. The KMusic widget package is not from Komponents, but rather individual layers, meaning that they are more customizable if you really want to tinker with them, but it also means that when you want to just repaint things, be prepared to dig into each item that are not properly labeled for easy identification and change. KMusic has two packages, the original and the new KMusic 2, and both are worth widgets, but KMusic 2 is a younger, smaller package. There are free and paid versions of KMusic, and KMusic 2, being new, smaller and still improving the package, the only free version available right now. If you're such a music listener who really, really wants to tinker with widgets, KMusic is for you. KMusic 2 (free) Is your turn It stopped working on my phone on Android 9. Many others say that ... Thank you! I know this question has been posted before, but most of the answers I've seen are out of date. Many suggest using Media Utilities, but it seems this app does not support spotify since Lollipop.I tried to edit Spotify APK myself, but I couldn't figure out which image file is being used as a background for the widget. Any suggestions for alternative widgets that give me the possibility of transparency, and what is working with Spotify's Marshmallow? Is it something that, as a complete beginner, could I learn to do on my own? I would assume building a widget is much easier than building an entire app, right? I would appreciate any advice or suggestions! EDIT - Decided I saw people offering Jack's widget in old posts, but when I looked at the app, the latest update said it was updated for Kit Kat 4.2, so I thought it was out of date. I just downloaded it and it works great with spotify! Page 2Mail byu / removed 4 years ago 4 comments comments
