Weather Pack is an environmentally sealed connectivity system developed by Packard Electric engineers (now Delphi/Packard Electric Systems) to withstand exposure to extreme temperatures, humidity and fluids that prevent harsh engines and chemicals with unchanged performance. It consists of thermal mating stable polyamide housings (Weather Pack towers and shroud), male and female batteries and socket Weather Pack terminals and self-lubricating silicone Weather Pack connecting seals, cable seals and plug compartments. The system is rated 0.05–16.0 VDC, 0-20A. The Weather Pack connection configuration is available for one to six wires. What is the Weather Pack section code? The WP ... The phone number is ours. The 8-digit numbers in parentheses are Delphi/Packard Electric numbers. What is the maximum current rating for Weather Pack connectors? Delphi Packard Electric Systems rates the Weather Pack at a maximum of 0 - 20 amps. How to choose the right size cable seal? The choice of cable seal is determined by the insulation diameter of the wire being used. The instructions provided below apply to the Weather Pack and the Metri-Pack 280 Series sealing installation. F or type gpt and GXL wire, red seal usually fits 22 gauge; Green seals usually match 20, 18, and 16 gauge; gray seals are usually suitable for gauge 14; and the blue seal usually fits 12 gauge. For heavier wall type SXL wires, green seals are usually suitable for gauges 20 and 18; gray seals are usually suitable for 16 gauge; and blue seals are usually suitable for gauges 14 and 12. For wall-thin wire construction such as TXL type, red seal usually fits 20 gauge; green seals are usually in line with gauges 18, 16 and 14; gray seals are usually suitable for gauge 12; and the blue seal usually fits 10 gauge. The installer must make sure that the seal fits snugly on the wire insl how to maintain a proper environmental seal. Click the Online Category button and navigate to the Useful information page for main wire instable diameters and plenty of Delphi cable seal application information. Why is the Weather Pack available in 12-gauge if the maximum current rating is just 20 amps? The Weather Pack 12-gauge terminal is designed for signal voltage, where the conductor reliability is very important. A larger conductor will provide a clearer signal than a smaller one. Gauge 12 12 Terminal packaging should not be used in high current applications which would normally use 12-gauge wires. Is there a closed connection system that will carry more than 20 amps of the Weather Pack? The Metri-Pack 280 Series connector will carry up to 30 amps, and be available in one, two, and three wire configurations. A closed Metri-Pack 480 Series connector set is available in a two-wire configuration that will carry up to 42 amps. A closed Metri-Pack 630 Series connector set is available in a three-wire configuration that will carry up to 46 amps. Why are there openings on some individual towers on the Weather Pack tower connection? Slots are called indexing slots and they prevent mismating. A Weather Pack tower connection will only fit the appropriate Weather Pack shroud connection. What does the color that connects the Weather Pack tower show? Colors are used with application-specific Weather Pack connectors to make them look different from standard tower connectors. Color connectors are designed to fit devices such as switches or sensors. They feature special indexing and are not interchangeable with standard black tower connections. I'm looking for Weather Packs with flat male blade terminals or square profile female terminals. Do you have them? The Weather Pack system uses only circular battery terminals or circular socket terminals. If a closed connection without a circular terminal is marked DELPHI or P.E.D., it can be a Metri-Pack, a GT or a Ducon line connection. We reserve many different Metri-Pack components. Send us a sample or an image of what is needed and we may be able to identify and provide your request. Do I need a bending tool made specifically for the Weather Pack? Not necessarily. Many open barrel bending tools can make a Weather Pack wire acceptable. A bending Weather Pack seal can be made with general sliding pliers. Note that the bending seal should be only solid enough to hold the seal in place. A tightly bending seal can damage the seal. Professional tools are made specifically for Weather Packs that bend both terminals and seals in one cycle. We are considering buying your professional T-12 curling tool. It looks different from your other crimping tools. How is it used? Click here for our T-12 guide. What does a proper Weather Pack bending look like? As?
