Ring of fire news network

Nothing is as festive as an open fire at outdoor parties and gatherings, but you may be wary of lighting one because of the potential danger. A fire ring is the perfect way to bring the atmosphere of a fire to gatherings without worrying about the fire burning out of control. These long-lasting metal rings provide warmth and comfort and offer a focal point for your outdoor parties. How do you choose the right fire ring for your garden? This purchase guide introduces you to all the features you need to consider before you buy one. From construction and appearance to size, grills and price, we examine all aspects of these products and outline what to look for and what to avoid. We also offer some of our own favorite fire rings and share what features led us to choose them as some of the best out there. Important considerations

DurabilityBetween weather and flames, your fire ring is going to take a lot of abuse. To withstand that abuse, it should be constructed from a durable material such as steel, and the thicker the better. You will find rings made of thin metal, thick rolled steel, and even cast iron. In addition to weather and fire, a fire ring should be durable enough to withstand the occasional ding or bulk if you move it or have a habit of throwing logs into it a little too carelessly. **Appearance**To have a fire in your outdoor living space is special, so spend some time choosing a fire ring that appeals to your taste. **Color:** As a fire ring will be a focal point for outdoor gatherings, you want it to be attractive. Most fire rings are round and painted black, usually with a paint that can withstand high temperatures and protects the ring from both weather and fire. **Lip:** A lip around the top and bottom can not only add to the appearance of the ring, but also provide stability and keep the ring from warping in high heat. **Size**Some fire ring manufacturers/sellers offer a variety of sizes to choose from. **Diameter:** The diameter of the fire ring determines the length of the logs you can burn in it, as well as the size of the fire. Fire rings typically range from 27 to 36 inches in diameter, with some as large as 48 inches. **Depth:** The depth of the fire ring will also affect the size of the fire. In general, the deeper the ring, the better it will be able to keep the fire and the more control you will have. Fire rings range from about 8 to 14 inches deep. **Weight**Even more than size, fire rings vary greatly in terms of weight. You'll find fire rings weighing less than 6 pounds and rings weighing 60 pounds. A heavier fire ring provides more stability, while a lighter one is easier to move around. If you plan to put a fire ring in one place and leave it for several years, a heavier option is the best option. Heavier rings are also usually made of thicker steel, which will add years of life to the ring. **Assembly**There is not much for these fire rings, so any assembly you need to do should not be too difficult. Most of them send in several parts that need to be assembled, usually with bolts. The easier these are to put together, the easier they are to break down and move from place to place. The fire ring should be supplied with all the necessary hardware and instructions for the construction of the ring. Make sure you have all the parts and know what tools you need before you start installing it. **Did you know?** Built-in mesh can help keep sparks and coals from falling out of fire ring carvings. **STAFF Best Reviews**But not standard, some fire rings make ships with a barbecue, so you can easily turn the fire into a cooking fire. A barbecue should have a way to swing out of the way so you can attach to the fire or just enjoy the ring in bonfire mode without the grill in place. **Drain/ventilation hole**Fires burn poorly without proper ventilation. An effective fire ring should have holes in both the top for ventilation and the bottom for ventilation and drainage. Drainage is important to keep water from pooling in the fire ring, which can cause the metal to rust. **Cutouts**Cutouts are decorative holes carved into the fire ring, usually in the form of animals or trees. The fire will get plenty of ventilation from these carvings, eliminating the need for additional ventilation holes. Carvings can be an attractive decorative element in a fire ring, especially at night. Children love them, and they provide a much better view of the fire itself. Some fire rings include mesh inside the house to keep coals or pieces of wood from falling through the carvings. **Did you know?** Lips around the top and bottom of a fire ring can help stabilize the ring when in use. **STAFF Best Reviews**There are some additional tools you need when using the fire ring. Some fire rings come with accessories, but for others you need to buy them separately. **Poker:** Sunndaze Decor Fire Pit Poker If you need to move logs around in the fire ring, you need a long-handled poker. This 26-inch steel poker from Sunndaze Decor has a wooden handle and comes with a one-year warranty. **Spark screen:** Sunndaze Fire Pit Spark Screen A spark screen can help protect you from sparks and embers that can occasionally shoot from the fire. A must for those who have children, this option ships in several sizes and includes a one-year warranty. **Cover:** Classic accessories Terrazzo Fire Pit Cover Protect your fire ring from snow, rain and even sun damage with this classic accessory cover. It fits fire rings and pits up to 44 inches in diameter and includes an elastic wire on the bottom for a snug fit. **Fire ring prices**While you can find some fire rings for under \$30, most are in \$100 to \$350 with some higher. Lower priced fire rings tend to be constructed of light steel and have a smaller diameter. These are better for anyone seeking a portable fire ring for a smaller fire. Pay more and you'll find deeper, wider fire rings made of thicker steel. These tend to survive cheap fire rings of years. They also weigh more and include extras such as a barbecue or mesh screening. You are also more inclined to get a warranty with a fire ring in this area. **Did you know?** Some fire rings are designed to be used as a fire pit liner in the ground. **STAFF Best Reviews** Check for small carvings. Carvings in a fire ring can add plenty of atmosphere to your party, but avoid buying a ring with very large carvings, or you may have problems with hot coals falling out of the ring. Do not use the fire ring with water. The sudden change in temperature can desiccate the metal. Place the ring of fire on the pavers or bricks. While you can place a fire ring on the ground, you will add both appearance and safety by placing it on a flat surface made of brick or pavers. It will also be easier to clean the fire ring. But avoid placing bricks or pavers around the sides of the fire ring, because this can cut off the ventilation and result in a bad burning fire. Note one problem with using stone: when heated, some stones with trapped gas or water pockets may explode. Keep the box. If the fire ring is easily dismantled and you plan to use it in a variety of locations, hold on to the original box to store and transport it. It is easier to carry the ring around and you will not cover yourself and vehicles in ash and stains. Tap the paint. These rings usually ship coated in a high temperature paint to protect them from both the fire and the elements. You can extend the life of the fire ring by picking up your own high temperature paint and recoating the ring - inside and out - once a year. Be sure to clean the fire ring completely first. Use pieces of wood that are all the same size. For a more uniform burning fire that can be more easily controlled, use pieces of wood that are all about the same size. There are plenty of fire rings out there and we wanted to recommend a few more. **Pleasant Hearth Infinity Galvanized fire ring** differs from other rings with its silver finish. Its 36-inch diameter and 13-inch depth provide bigger fires than many other fire rings on the market. At 27 inches in diameter, the **Camco Portable Campfire Ring** is at the other end of the spectrum. With pine cutouts, this six-sided ring breaks down for easy movement and includes a carrying case. And while you might pay a little more for it, **P&D Metal Works Outdoor Campfire Ring** an exceptional building and a 48-inch diameter that will push the fire into bonfire territory. We also like whitetail deer and pine carvings. **Questions.** Which is better, a wood or gas fire ring? gas fire ring? There are two primary types of fire rings on the market: wood burning and gas burning. Both have their advantages and disadvantages. Wood-fired fire rings are easier to set up and cheaper to use than gas. Wood tends to put out more heat than gas, and some users feel that the atmosphere of a wood burning can't turn. on the other side, propane can be a safer burning option than wood, and it is certainly easier to control when it comes to being able to quickly start and extinguish a fire. However, gas can become more expensive to use, and it does not rise quite to the same comfort level as a wood burning does. **Q.** Can I put two of these rings together to make a really big fire ring? **A.** In general, no. These usually ship out in several parts, so you might assume that it would be an easy job to add a few more sections and end up with a larger ring. The truth is that the different angles/arches will not bolt together in a smooth circle, even if you could line up the bolt holes correctly. **Q.** How can I safely use my fire ring? **A.** Like everything else involving fire, there are a number of steps you can take, generally all common sense, to minimize the risk when using a fire ring. You should always keep children and pets away from a warm ring. Do not wear loose, flammable clothing when setting the fire. Try to burn hardwood, as softwood can create more sparks. Always have a way to quickly douse a fire, by either having a fire extinguisher or hose handy. Never use accelerants such as petrol to light a fire. And let the ash cool completely before trying to get rid of them. **Them.**
