Samsung 55-inch TU8000 deals SAMSUNG 55-inch class Crystal... Samsung 55 inch TV 2020 LED... Over the past few years, the Samsung 8 Series has been a great go-to option for TV buyers wanting to balance performance and price in a way that once seemed unfathomable. The TU8000 doesn't quite represent the top of this range, but it's just one step down, sharing a lot of the TU8500's boasts, but with an even more attractive price tag. It uses Samsung Crystal LCD UHD panel technology, and promises ease of use, minimalist design, a selection of built-in voice assistants and best-in-class smart TV system. There are also a number of screen sizes to choose from, so you can really make it work for your space. Although its frame is largely made of plastic, the TU8000 is a really well-built TV. It's just a shame Samsung decided to use the hard-to-put wide-legged stand on this model and also scrimped on HDMI inputs - especially when one of them becomes unusable if you decide to wall-mount it. However, there are no such grumbles that will be available on a smart TV system that has all the on-demand and catch-up apps that you might want, including Netflix, Amazon Prime Video, Apple TV and Disney Plus. There's even an art-ambient mode included here, appearing outside the RANGE of ZLD for the first time this year. There's no doubt that the painting comes with some limitations on its price, but overall the TU8000 impresses with its natural color processing, crisp, detailed pattern, solid motion handling and good enhancement. It needs some tweaked settings to perform to the best of its ability, however. As is often the case, the audio performance in the TU8000 is not much to get excited about, but not the worst we've heard. Overall it's just on the flat side, with a little way of dynamics and organization, but offering a decent amount of weight that stops it from sounding too thin. The sound bar won't go wrong, but the sound projection it manages and the clarity through the middle of the range will almost allow you to skip it if your budget is limited. At a price, the TU8000 offers good performance that requires some managed expectations. Peak brightness is limited so HDR is not at its best and the colors don't have the pop that you'll see on expensive sets. But the detail is fantastic, the black levels are strong and overall it is a natural and attractive picture that has its own against the competition. It may not be as impressive as last year's RU8000, but pay a little attention to the image settings on offer and you can still create a picture of the performance that offers Value. (Image credit: Verity Burns) Price and affordability

Screen Size	UK Price (€)	US Price (\$)	AU Price (AU\$)
43-inch	429	499	499
50-inch	899	1,049	1,049
65-inch	1,299	1,599	1,599
75-inch	1,999	2,499	2,499
82-inch/85-inch	1,800	2,200	2,200

Price and affordability

Ace in six different screen sizes, from 43 inches to 85 inches

5-inch version are considered here retail sales for 599 / \$500 / AU \$1299

Overall cheaper than last year's RU8000 Samsung TU8000 TU8000 in the UK, US and Australia, with the only difference being the 85-inch option available in the US - instead of the 82-inch in the UK and Australia. In addition, the line is the same in all areas, including 43-inch, 50-inch, 55-inch, 65-inch and 75-inch models. We've reviewed the 55-inch version of the TU8000 (599 euros/\$500/AU\$1,299), but otherwise you'll pay 429 euros/\$350/AU\$949 for 43-inch, 499/\$400/AU\$1,049 for 50-inch, 899 euros/\$700/AU\$1,599 for 65-inch, 1,299 euros/\$1,200/AU\$2,499 for 75-inch and 1,999 euros/\$1,800/AU\$3,699 for 82-inch/85-inch. There are still a few screen sizes to choose from this year compared to the ru8000 last year, and while prices in the UK tend to be the same, the US and Australia have seen some price cuts. For example, the

prices for the 55-inch test here are the same as last year's RU8000 in the UK, but the same model in the US and Australia comes in at \$150 and AU\$300 cheaper respectively. Samsung TU8000 Specs Size: 43-, 50-, 55-, 65-, 75-, 82-inch Tuner: Freeview HD 4K: Yes HDR: Yes Panel Technology: LCD Smart TV: Yes, Tizen Curved: No Dimensions: 1231 (w) x 783 (h) x 250 (d) mm Weight: 14.2 kg 3D: No Input: 3xHDMI 2.1, 2xUSB, 1xRF, CI slot, Ethernet Out: 1x optical Design: Sturdy and stylish, despite the fact that the main plastic wide stand is uncomfortable to accommodate The HDMI's are a bit stingy About this price, it's probably no surprise that the TU8000 design consists mainly of black plastic, through the back panel, framing and stand. It still manages to feel well built despite this, with some reassuring weight when getting it out of the box, and minimal framing ensuring the set still looks stylish, plastic and all. Why Samsung decided to bestow wide legs on this model though - or any TV, for that matter - is anyone's guess. The central stand, as it is on the TU8500 model above this, is much easier to place when it comes to placing large TVs on furniture. As it is, UE5TU8000 will require a TV stand of at least 103cm, so make sure your current setup can accommodate it first. Of course, you can choose to wall mount this TV instead, and there are no unsightly lumps or bumps on your back to make this an issue. In fact, just 6 cm thick, it should sit pretty snugly against the wall. However, it is worth noting that one of the HDMI ports will become unusable in this position due to the fact that the rear cladding is a shame, given that there is already a rather stingy offer. We used to have four HDMI's to choose from, even at this price, but the TU8000 only has three. This means that even a fairly modest set-top box setup, a Blu-ray player and a game console will These parts are off, with one lost if the set is mounted on the wall. Other ports include two USB, composite video, RF antenna input for terrestrial tech, CI slot and Ethernet Ethernet for when Wi-Fi won't cut it. There's also an optical outlet to tap the sound on the sound panel. As is usually the case with Samsung TVs, two remote controls are included in the box - chunkier the standard-looking one and the more subtle, simplified version. The latter has all the basic features that you will use most often, without those that you won't. This includes a ring-shaped D-pad, a channel and volume control, shortcuts for Netflix, Prime Video and Rakuten TV and buttons to activate Samsung Ambient Mode (more on that later), your voice assistant of choice and for general navigation. This remote can also be configured as a universal control for other devices that you'll be prompted to use during the initial setup. (Image credit: Verity Burns) Smart TV (Tizen) Easy TV installation via SmartThings app Tizen is still one of the best smart TV systems out there. It works very well, even automatically adding Wi-Fi details it digs out of your device, so you don't have to mess around with the keyboard screen, which is always welcome. It also invites you to download any additional on-demand apps that you may like on TV, and choose a voice assistant, as well as help you customize OneRemote as universal management for all your sources. Once completed, the TU8000 will appear as a device in the SmartThings app along with any other compatible devices that you may have in the home. You can control the TV through your phone if you misplaced the remote control... or just can't be bothered to get up to get them. Samsung has long offered one of the most complete smart TV systems through its Tizen platform, and that hasn't changed in 2020. It's had a few small design settings since last year, but the navigation is pretty much identical and still as simple as it used to be. This means that one of the home button taps will bring up a number of your installed apps that are currently smaller to fit more on the screen, and highlighting any of them will show the secondary line of suggested content or actions. This content will be customized to your browsing habits if you've merged into this particular app, so Netflix will offer to continue what you watched the last time, for example. Virtually every on-demand service you might want to attend, including Netflix, Amazon Prime, Apple TV, NowTV, and Disney Plus, as well as all services catch up with the UK, from BBC iPlayer to My5. There's also an app store for adding other apps, including UKTV Play, BBC Sounds and Spotify, with the order of apps you add to your home menu fully customized to your preferences - now you can fit 14 on the screen at any one time. Scroll down from this basic series of apps and you'll come to Samsung Samsung Samsung Hub, with rows of TV and movie recommendations, albeit from a limited number of vendors. Most of the options surfaced for us seemed to be from Apple TV, Chili or UKTV Play and while it was interesting enough, it's a shame not to see more popular sources included like Netflix, Amazon or BBC iPlayer. We didn't find ourselves using it at all. You get two voice assistance options, in Alexa and Samsung Bixby (Google Assistant soon). Alexa can work in conjunction with any Amazon speakers you might have, and is usually the best choice of the two for general voice assistance, although Bixby offers more through specific TV controls such as changing input via voice. It still feels like a bit of a clunky inclusion that we've rarely found need to use, but it's there if you want it. Samsung's ambiable mode is being included as standard on the TU8000, with the feature extending its horizons beyond the LED range for the first time this year. It's a feature that was adapted from the art mode originally launched on Samsung Frame, and allows you to have a selection of artistic photos, patterns or your own shots appear on the screen when you're not watching TV. The TV sensor will detect the brightness of the room and adjust the image accordingly, so it's more like a picture than a TV that's just stayed on, which in turn saves energy. You can also set a timer to make sure it shuts down after a while. It's not as convincing as Samsung's frame as a work of art, mainly because the TU8000 screen is more reflective, but it's nice to see the feature seep down the range though. (Image credit: Samsung) Image quality Sharp, detailed picture Panel is not the brightest, so HDR can struggle Decent upscaling This UE55TU8000 capable of a very good picture at its price, but outside the box setting needs a bit of work to get the most out of it, especially with HDR content. This is because the peak brightness of this set is on the low side. Even with the brightness turned high in the settings, you'll probably find yourself wanting more, especially with dark scenes in well-lit rooms. So before we talk about the picture, let's talk about how to get it looking for its best. The first thing you need to adjust here is the image mode, which is the most accurate within the film. Many will prefer the attractive colder tone of the Standard, which is also a little brighter, but if you're looking for the most accurate picture and color palette, Movie is an opportunity to go on. The movie mode has its brightness and contrast knocked off the touch from the maximum and we recommend keeping them there. It's a much thinner picture, if you do. You can push the brightness up to touch if you feel you need it. The color tone is sucking between Warm1 and Warm2, and we'd ensure sharpness is always at 0 to avoid extra noise. You can leave the color color Hue settings where they are. We usually recommend turning all the added image processing to the purest picture, but in this case, Samsung Contrast Enhancer works wonders for providing this picture the added oomph it needs, especially in dark scenes. With SDR content you can probably keep it on low, but with HDR content, you'll get more influence, albeit with less subtlety, set at a high level. The TU8000 recognizes whenever you play compatible HDR content and automatically goes into HDR mode, so any settings you change at the moment will only remain valid for HDR content. Finally, the motion settings fall under an option called Picture Clarity. Choose custom, and you can set the judder settings yourself. Something around 3 or 4 seemed to work best for most of the content we looked at, and the traffic was, for the most part, remarkably stable. With the image where we want it to be, we settle down with the Joker's 4K stream on the sky of the W. The outlines are surprisingly clear and there are stacks of details to go at, from the makeup texture on Joaquin Phoenix's face to the details in Gotham's buildings in the opening scene. More capable sets (read: more expensive) will offer a little more in order of depth and extra small details, but for medium TV, there is very little to grumble here. Colors are good to judge too, and there's a natural enough punch here to keep the picture attracting. The TU8000 even does a great job with skin tones, a complex balance that TVs at this level can't always manage. The lack of a broad color scheme for HDR in the TU8000 means you're unlikely to be blown out-and-out by the vibration of the TU8000 when watching HDR, but the subtle way it handles its color palette and shading is still beautifully done. While the colors probably won't be described as bright, they are also far from washed out. (Image credit: Verity Burns) If there's an Achilles heel here, it's a dark scene when staring into anything other than a very dark room. Even then, they struggle to impress as the screen tries to balance the dark and light parts of the scene. There's no doubt that Black can go deep, but the shadow detail and highlights are loose in the process. As the edge of the illuminated set without a local blackout, the TU8000 will always struggle in such situations, but with the Samsung Contrast Enhancer included, you can quickly improve the balance and give these scenes much more difference. This is especially useful with HDR content. When streaming Ozark from Netflix, we were able to turn previously dull dark scenes while watching in daylight into something much more punchy and enjoyable. Even the viewing experience in a dark room is greatly improved. With Contrast Enhancer set at a high level, highlight the details much brighter along with those deep black, and with very little flowering. It even helps to bring out some some which might otherwise have been lost in the shadows. As mentioned, the extra processing does the sweat with some subtlety in search of better contrast, especially noticeable in bright scenes, and also adds to some noise. However at this price, this is a compromise we are willing to make. The result is not as accurate or dynamic as HDR may be at its best, but you won't find many TVs at this level doing much better. Just keep in mind that, as is the case with all Samsung TVs, there is no Dolby Vision support here, only HDR10 and less spotted HDR10, as well as HLG for broadcast. Transferring HD/SDR content with Amazon Prime stream Iron Man 2 and TU8000 manages wonderfully. Its upscaling is pretty good, and while it can't pass for a native 4K, there's still a good level of detail to get your teeth in, without noticeable extra noise. The colors are as well handled here as they are in HDR, so the red and gold Iron Man costumes are suitably striking without being on top, while the contrast in the dark scenes remains impressive with the help of extra processing. Even SD terrestrial TV content looks decent. It's a little bland on the details, as you'd expect, but even with the further noise that creeps, it's a solid pattern with a good color balance that's completely watchable. The only downside to all this is the viewing angles, which are annoyingly tight. Sit too far off the axis and you lose a fair bit of contrast and color saturation that takes away from the overall performance of the image. If this is the TV for you, just remember the bag central seating position for movie night. (Image credit: Samsung) Audio Performance 20W Stereodynamics Tizen settings to choose from are not scary, but nothing to write home about The TU8000 offers three sound settings to choose from in the menu's main settings. It will eat with the standard selected out of the box, but you can also choose adaptive or enhanced settings. We like the added whallop from the adaptive, which strikes a good balance to add some weight to the low end without losing on too much clarity through the middle of the range. This low end still lacks the power and depth you get from the soundbar, but at least help give some soundtrack presence and make sure it doesn't sound too subtle. High frequencies are still a bit on the sharp side, but not much that becomes uncomfortable to listen to. Organization is not the best to have dialogue get a little lost in lively scenes, but overall it's ok if lacking a bit of detail. As is usually the case with the sound of the TV, especially at this level, it's just a bit flat, and lacks the dynamic means to jump between the subtlety required for quiet scenes and oomph required Large. You want to invest in a sound panel for this. It does a good job of projecting sound though, so you must push the volume out of their comfort zone, which is welcome at this level. Should I buy a Samsung UE55TU8000? (Image credit: Samsung) Buy if ... You want a good value Samsung 8 Series TV has always been a great mean for those who want a good TV without spending money on the LED range. This is absolutely what you get with the TU8000, and while there are some areas we'd like to see improvements with, there's no doubt the cost of a 55-inch TV at 600/\$500/AU\$1,299. You use on-demand Samsung Tizen apps is one of the best smart TV systems you can get, and comes with the most impressive app lineup on the market. If you subscribe to the video-on-demand service, it will be here as all of the UK catch up services too. Never again will you mumble the suggestion there is nothing on TV... You want a good selection of screen sizes you can say that it is a popular TV for Samsung, by the number of screen sizes on offer. This means that whether you're looking for a basic TV or a secondary set, there's screen size (and budget) for you. Don't buy it if... You want to see the best of HDR Low overall brightness and lack of broad color scheme on the TU8000, not to mention the fact that Samsung does not support Dolby Vision, does not limit how well this TV can show HDR content. Some tweaking settings may help make it that a little more efficient, but the true advantage of HDR won't shine here. You have a wide viewing area of Viewing Corners not a strong point of this TV. If you have a hall where people will watch this TV from a variety of places, they will get a completely different experience from someone sitting right in front of it. You have a small TV stand These wide legs make this TV a little difficult to place on more compact stands. If you're tight on space and need your TV to be a little more understanding of this, the TU8000 may not be the TV for you. You.
